# Alfalfa Enriches the Soil and the Farmer

Up to their Eyes in Alfalfa in Hanford, Kings County.

THE original home of alfalfa appears to have been near central Asia, but from there it has been carried to practically every part of the world where agricultural pursuits are important. It is now one of the staple forage crops of every continent of the Old World. The name "alfalfa" is of Arabic origin and means "best fodder." The southern European name of "lucern" was formerly applied to the plant in the eastern part of the United States and in Utah, but this name has practically given way to the name "alfalfa," under which it was introduced by the Spaniards.

Making Alfalfa on the State Farm at Davis.

The history of alfalfa in the Eastern States runs back for at least two centuries, as the colonists made repeated attempts to establish it. Under the name of "lucern" it was introduced into England about 1650. The attempts on the part of the American colonists to establish it were unsuccessful. The limestone region of central New York probably constitutes the area of its longest continued culture in any section of the East. In South Carolina there is a field reported to be seventy-five years old.

***The streets of Kerman congested by loads of alfalfa hay waiting to unload at the mill. When photo was taken 40 loads were waiting***

# The Dairyman's Paradise

Say you! Mr. California Dairyman, are you living in a locality where it is impossible to pasture your cows during the winter months; are you living in a locality where a shortage of water makes it impossible to have pasture for your cows during the summer season?

Both of these difficulties can he overcome hy moving to the

## Kerman Tract

where there is an ahsolute guarantee of summer water and where stock can be pastured all winter without injury to the land or alfalfa roots.

In addition to these advantages the

## Kerman Tract

offers you the best market in the State for your product. The new creamery to be erected this season will handle your cream and pay you a higher price for butterfat than you can possibly realize by making your own hutter, or shipping your cream. The close proximity to the San Francisco market, where it is almost impossible to supply the demand for sweet cream, makes this a fact and not something to he realized.

## Alfalfa--Key to the Situation

On the **Kerman Tract** eight tons of hay can he grown per acre every year when the alfalfa has been firmly estahlished. The alfalfa mill at Kerman supplies a steady and constant market for all the hay the farmer can grow and not needed for his own use.

Ten acres of well estahlished alfalfa will supply pasturage for the year round for 15 cows, and hy supplementing the pasture with pie pumpkins and cow peas grown in between the rows in the young peach orchard, more cows can be kept on ten acres.

## Ideal Dairy Conditions

On the **Kerman Tract** more ideal conditions prevail for dairying than at any other point on the Coast. Considering the advantages of soil, water and market, land is dirt cheap—cheaper than it will ever he again, and it is easily possihle for the dairymen to net $75.00 per cow every year.

We are dead anxious to have you come and look us over. You don't have to and we don't want you to take our word for anything. It is here to see and it is up to you to know we are offering the best proposition for dairying to he found anywhere in the country.

For prices, terms and other information, either write to

# Angle Lamp

## The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

**NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.**

**GREAT ECONOMY—COST LESS TO BURN** than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT,** soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

# Practical Methods in Alfalfa Growing

## Letters from Growers Who Know With Many Suggestions of Value

"THERE are some silent subsoilers that do their work with ease, and in their way, more effectually than any team or plow ever hitched. The clover plant is righteously famed as one of these, but alfalfa is its superior. Its roots work Sunday as well as Saturday, night and day; they strike five, ten, fifteen or twenty feet deep, making innumerable perforations, while storing up nitrogen, and when these roots decay they leave not only a generous supply of fertility for any desired crop, but millions of openings into which the air and rain of heaven find their way, and help to constitute an unfailing reservoir of wealth, upon which the husbandman can draw with little fear of protest or overdrafts. Its long branching roots penetrate far down, push and crowd the earth this way and that, and thus constitute a gigantic subsoiler. These become an immense magazine of fertility. As soon as cut, they begin to decay and liberate the vast reservoir of fertilizing matter below the plow, to be drawn upon by other crops for years to come."

The above quotation is from Coburn's "Book Of Alfalfa" and shows an easterner's appreciation of that which California has appreciated for years. In fact, the wonderful plant is becoming more and more a staple wherever its remarkable capacity for bringing from the soil the protein so much needed by all stock has been shown.

There has been much discussion as to who deserves credit for the first introduction of alfalfa to the Pacific Coast, but the date of its introduction is so far back that no definite or at least absolute information can be given along this line. But going still farther back into its history, it has been ascertained that it was carried by the Persians into Greece at the time of the invasion of Xerxes in 490 B. C. It was later utilized by the Romans and taken to Rome in 146 B. C. Before the Middle Ages it had become fairly well spread over Europe. It was probably brought to this coast from Spain, though legend states that it came here from Chile in 1853 or 1854.

It is an exceedingly long lived plant. Fields are known now to exist which were planted fifty years ago, and some people maintain that there are fields more than a hundred years old.

Alfalfa is the more common name, but it passes as lucerne, French lucerne, Chilean clover, Mexican clover, Brazilian clover, and in fact, is known by many other names according to locality.

### Varieties.

The one principal variety grown in this country is the so-called ordinary alfalfa or Chilean clover, which is, to be more exact, medicago sativa. In recent years through the efforts of the Department of Agriculture at Washington other varieties have been introduced. That known as Turkestan has had extensive trial in this state, especially at Tulare. The Cultivator recently published an extract from the letter of a subscriver in which he referred to his experience with Turkestan, five acres of which he had planted in the midst of a hundred acres of the common variety. The Turkestan in no sense came up to the standard of the better known variety of alfalfa. Reports have come, however, from sections where drouth is persistent and the supply of water for irrigation slender, that Turkestan has proved more valuable than the Chilean. It will probably show a more favorable comparison in the colder northwest than the warmer sections of California.

More recently there has been tried in California, and so far as reports have yet come in, proven wonderfully successful, a new variety introduced by the Department of Agriculture and known as Arabian alfalfa. This has proven a better winter bearer and fully as good a summer bearer as the Chilean. A serious objection to it, so far as reports have been made, is that it has not seeded in this state. Whether this is due to the plant not yet being of proper age, or whether our climatic conditions are such that their effect must be overcome, remains yet to be determined. One of the largest fields of this variety is that of Mr. Washington Wilson at Holtville. He has five acres in one field. It did not seed last year and has not yet this year, but its bearing capacity and its quality are very highly spoken of by Mr. Wilson.

Alfalfa is a legume and consequently a nitrogen gatherer, and, as shown in the opening quotation in this article, is a wonderful soil enricher, and this effect on the soil is usually of great importance to the grower. Its value as a dairy feed has long been well known, but even its warmest friends were hardly prepared to agree with the statement that a ton of alfalfa was of far greater value as a dairy food than a ton of bran, for the statement has been made that a ton of alfalfa leaves contains as much protein as 2800 pounds of bran.

It is proper that the culture of such a valuable plant should be in every way increased, and to the end that we might gather together as valuable a fund of information from practical growers as possible, the Cultivator recently sent to producers of alfalfa in various sections of the country the following series of questions, with the aim of learning the best methods of preparing fields for planting, harvesting the crop, etc. We believe that the information we have thus obtained will prove of utmost value.

### The Questions.

1. Do you grow the common, well known variety (medicago sativa) or have you tried "Turkestan" or "Arabian" varieties?

2. (a) Do you irrigate? (b) How high do you build your checks, or rather banks between checks? (c) How deep over ground do you prefer to have water stand?

3. (a) What plowing or harrowing do you give to the land to get it ready for planting? (b) Do you inoculate seed or ground with bacteria?

4. (a) What time of year is best for seeding, and how much seed per acre do you sow? (b) Do you drill or broad cast? (c) Do you screen your seed, or endeavor to exclude weed or dodder seed. (d) Do you plant nurse crop?

5. (a) After once established do you disk? How often? (b) Have you ever applied lime, gypsum or fertilizer? With what results?

6. Is the first cutting of spring mixed with foxtail. If so, do you handle in silo, or how?

7. How many cuttings do you make per year?

8. (a) Do you sell hay or feed it on the place? (b) Do you allow stock to pasture at any time of year? (c) Is your stock troubled with bloat?

9. What pests do you have to contend with, and how do you handle them?

10. Do you rotate or do you allow alfalfa to occupy same field for years?

11. Have you grown alfalfa between orchard trees? Does it affect productiveness?

12. (a) In harvesting how do you judge proper time for cutting? (b) How long after mowing do you rake, cock and stack? (c) Have you ever used caps of cloth for the cocks?

### Guy H. Miller, Modesto, Stanislaus County.

1. I grow the common variety; have never tried any other.

2. I irrigate. I consider sixteen to eighteen inches about the right height for levees between checks, and have them well rounded. I let water stand about two inches deep on the higher places. It will, of course, be deeper on other parts, as it is almost impossible to have checks perfectly level after they have settled. This is for rather sandy soil where the water does not stand for any length of time.

3. After leveling which is the most tedious and important part of the work, I plow the land deeply, then harrow well, till surface is well pulverized, before seeding. I have never inoculated either seed or land.

4. I sow fifteen pounds of seed per acre. Have sown more without getting any better stand. I have this season sown on December 23rd, February 2nd, February 17th and the last of February. Have succeeded in getting good stands with each sowing. One of my neighbors has sown later than February and has a good stand. I consider it very important to sow before all the rains are over so that the stand is well up before it is necessary to irrigate. Have not had any success in irrigating to get the seed up. I sow broadcast with a Cahoon seed-sower. I have never screened seed, but buy the best and cleanest seed obtainable. I do not plant any nurse crop. I think the young alfalfa needs all the moisture from the spring rains, also sunlight and air.

5. I have never disked; have cultivated with a spring-tooth cultivator, which did not seem to be of much benefit. I expect to try disking next winter to loosen up the surface of the ground. I use gypsum fertilizer, about 200 pounds per acre per year. It materially increases the crop and is not very expensive.

6. I have considerable foxtail in the first cutting. I cut before the foxtail is mature and feed it up at once.

7. The number of cuttings depends on the season. In dry years like last year the water supply was short after July and four good crops was all I cut. Year before last six crops were cut, and I expect to cut five or six crops this year.

8. I feed all the hay grown on the place. I do not pasture my alfalfa field. I think it injurious to a good stand. At times have some trouble with bloat when stock is fed green hay, or when fed hay which has been cured in a north wind and never gone through any sweat.

9. I have a field badly infested with dodder. This is the second season I have owned it. I think about the only way to get rid of it will be

# With the Citrus Growers

## FROST PREVENTION.

THE present weather is not conducive to consideration of frost protection. But all too soon that season will arrive and many citrus growers will find themselves in the position of the Irishman who didn't need to fix his roof when it was not raining and of course couldn't when it did rain.

Merely as a reminder in season, or in advance of season, we give the following observations by Prof. J. Warren Smith and printed by the Ohio Agricultural College:

**Conditions Favorable for Frost Formation.**

1. Clear skies. 2. Dry air. 3. Nearly still air.

All bodies are radiating heat all of the time. The surface of the earth and objects upon it are receiving heat from the sun, when it is shining brightly, faster than they are losing it by radiation; so the surface grows warmer until just after midday. The taking in of this heat is called absorption; and a body is a good absorber of heat that warms up quickly in the sunshine.

When bodies on the surface of the earth are loosing heat by radiation faster than they are gaining it by absorption, they are growing colder. Thus, at night the heat absorbed during the day is lost by radiation and the surface of the ground and the objects upon it become colder than the air. Good absorbers of heat are also good radiators, so that dark colored soil will sometimes be from 6 degrees to 14 degrees colder than a nearby light colored soil. The temperature over a dark colored lawn has been found to be 1½ degrees lower than over a light colored lawn.

Grass and growing crops loose heat rapidly at night by radiation and can gain little from the ground by conduction. Hence the temperature in grass six inches high has been found to be 10 degrees lower than over bare ground, and in clover two and one-half inches high 4 degrees lower.

Frost is usually seen upon a board walk or roof of a low shed first, be the leaves of standing crops lose ly by radiation and gain little from the earth by conduction.

When the surface of the earth and the leaves of standing crops loose heat by radiation, the air directly in contact with them gives up some of its heat by conduction, but this cooling extends up only a little way because the air is a poor conductor of heat. Hence the coldest air in a clear still night is near the surface of the ground. The coldest air will always be in the lowest places at such times, because this cooled air, being heavier than warm air, will slowly slide down into the valleys and hollows.

In protecting tender plants from frost, then, one has simply to keep in mind the conditions which favor frost damage and try to overcome these conditions.

**Methods of Protection Against Frost.**

1. Diminishing the radiation of heat.
2. Raising the dew point of the air.
3. Adding heat to the air.
4. Mixing the air so as to prevent its forming in layers.
5. Draining the cold air away from the section that needs protection.
6. The location of tender plants on the side of a slope and not in the low places.

Any covering will prevent the radiation of heat. Glass screens are used in greenhouses and cold frames. Cloth screens are stretched over large fields in France. Along the lower delta of the Mississippi the owners of valuable orange groves actually house in acres of the groves.

View of Redlands from One of its Orange Groves.

Strawberries are very successfully protected by turning the mulch up over the plants and cabbages by throwing a handful of hay over them. When it is cloudy, very little heat is lost by radiation; therefore, crops have been successfully protected by covering them with a smoke or a smudge.

If a damp material is burned, the smoke and cloud of moisture diminishes the radiation of heat, the moisture raises the dew point of the air, the fire adds heat to the air, and the air is mixed, so that the colder air cannot lie still near the earth.

A damp smudge may be made by burning numerous small piles of damp straw and stable manure. This material may be packed into old grain sacks and distributed through the orchards or garden in rows about 100 feet apart and about fifty feet apart in the rows. When it is found that the temperature is getting down near the freezing point, a small amount of oil should be poured on to every third or fourth sack and then set on fire. The sacks will burn with a smoldering fire for several hours.

An even better plan is to build a smudge fire upon some low wagon or sled, so that it can be drawn about through the orchard where needed. The simplest plan is to stretch wire netting from the four stakes of the

body, pile on damp straw or strawy manure, and then build a fire underneath. Set a barrel of water on the sled so that the straw can be kept wet.

As the sled is drawn along the vapor and smoke settle to the rear and fall close to the ground in a long white trail. One man can protect about ten acres in this way, and the expense of the sled need not be over ten dollars.

In some cases it has been found practicable to add dry heat to the air by burning coal in wire baskets. From twenty to forty of these baskets, costing from seven to ten cents each, are scattered over each acre, filled with coal and burned as needed. It has been found possible to raise the temperature of the air from three to five degrees throughout an orchard in this way and thus save damage by frost. The coal can be merely piled up in many small piles.

Gathering Oranges in Redlands.

### ASPIDIOTUS HEDERAE.

This scale is also known as Ivy Scale, Oleander Scale, Lemon Peel Scale. Perhaps there is no other scale in this locality which utilizes more plants for food than this one.

Courtesy Claremont Pomological Club.

From the various names given it we may conclude as to the principal host plants. It is found very thick on English Ivy. There are few such plants in this district which are not infested with it. So to many it is known as Ivy Scale. But on oleander it seems to thrive best. Not infrequently we find it so thick as to completely cover the entire surface of the leaf. It is found on many of the domesticated plants in the gardens and seems to feed on almost anything. In this country it has done little or no damage because as yet it has not taken to the citrus trees. However, this is not the case in all other localities. The illustration shows this scale infesting a lemon. This and many other specimens were obtained from P. E. Smith, Horticultural Commissioner of Ventura County. The picture tells the story. There it is known as the Lemon Peel Scale, and is a very bad pest. Perhaps it may never be so here, but who knows? It takes a long time to reveal all the characteristics of some of the scales. In new localities they may struggle along for years before they become acclimatized and do any damage. Because this insect has done no harm here to the citrus industry in the past is no proof that it will never do so. Anyway its record in other places stamps it as an unwelcome visitor.—E. O. Essig in Pomona Journal of Entomology.

### THE DISTRIBUTION OF LEMON SHIPMENTS.

The lemon is shipped from California every month of the year. The distribution is regulated somewhat by holding the fruit picked in winter and spring in common storage for several weeks or months before shipment. The lemon tree when handled properly is ever bearing, a tree containing at any time fruit in all stages of development from the blossom to the ripe lemon. The fruit ripens most abundantly during the late fall, winter, and spring, the heaviest harvest occurring from February to June in the coast region and beginning in November and December in the inland regions. It is the aim of the lemon grower to have the harvest as heavy as possible in the summer, when the fruit is in greatest demand, and he endeavors to influence the season of bearing to some extent by pruning and by irrigation, though not to the extent attempted by foreign lemon growers. The most profitable months in the lemon market are during hot weather from May to September, the condition of the market at any time during this period depending on the temperature at the point of consumption and the supply of imported fruit. The shipments from California are largest from March to July, about 60 per cent of the crop going forward during that period. The shipments in the last few years have been greatest in the months of May, June, and July. The fruit shipped in the spring and summer may include winter and spring lemons that have been stored, as well as the fruit that is picked during the spring and summer months.—G. Harold Powell in Year Book of Agriculture.

**RED SPIDER**

*One of the Worst Pests Known to Citrus Trees*

Is in abundance in Southern California at this time of the year. The Board of Horticulture recommends Sulphur to combat this pest.

# Deciduous Fruit Culture

By J. W. Mills

## CULTIVATING ORCHARDS.

CONSERVING moisture to make available the fertility of the soil is the principal reason why a mulch of some kind is required in the orchard. In the commercial orchards of both arid and semi-arid sections, the dust mulch is the most practical. After the spring plowing our leading apple growers use cultivators and harrows.

The water in the soil rises by capillary attraction. A compact soil has extending through it, minute spaces formed by the partial contact of its particles which facilitates the rise of water from moist layers below, in accordance with the same principle which causes the water to rise in a capillary tube. This movement is constantly going on in a firm soil, and as fast as the top layer is robbed of its moisture by evaporation, the water rises from below and it too is evaporated. During a long dry summer, the water rises and is evaporated from a depth of several feet in some soils, and the earth beneath the baking sun heat becomes "dry as a brick." Pulverization of the part of the soil which forms the mulch must be so complete that the particles are separated and capillarity destroyed, and further, that the free access of air to the lower point where capillarity exists, must be prevented. This is accomplished by the fine loose earth which acts as a mulch. When this is attained, only the moisture in the upper surface which comes in immediate contact with the air is evaporated and the balance is retained for the use of the plant. Plants or trees, growing then in well cultivated soil have the water in the lower soil held for their use, and as fast as they use it the supply is replaced through the firm soil below, which, evaporation being stopped, remains moist and permeable by roots which extend freely, seeking the nourishment they need, according to Prof. E. J. Wickson.

By actual experimental test, a soil well cultivated will hold nearly 30 per cent. more moisture than will the same kind of soil uncultivated. As the moisture under favorable conditions is largely the measure of the growth and the crop, it is plain that a mulch of some kind is imperative.

By the use of the harrows mentioned, or other shallow cutting tools, the dust mulch is in most cases cheaply made and maintained and therefore quite generally adopted.

There are several cases in both arid and humid sections where excellent results are obtained with the straw or hay mulch. In one instance where the rainfall is less than ten inches, fine four-tier Spitzenberg apples were grown where the ground was covered with straw mulch about five inches deep. In the Coast country, good results are obtained by growing a crop of clover or vetch producing at the rate of about 3 tons per acre, then cut during the last of June or the early part of July and spread to form the cover or mulch which serves practically the same purpose as does the dust mulch, with the additional benefit of the added nitrogen which these legumes fix in the soil, and subsequent fertility gained from the decayed vegetable matter. The straw or grass mulched orchards are usually confined to the smaller tracts or to the hillside locations, and due caution must be observed with regard to danger from fire, until the fall rains appear.

Where the mulch is kept up by harrowing it is necessary to go over the ground frequently. Set the tool to cut not deeper than three inches and cover the ground as rapidly as possible. Vetch or some other crop may be seeded in with the last cultivation and plowed under to enrich the ground the following spring.—N. W. Horticulturist.

## NUTS AND THEIR USES AS FOOD.

THE constantly increasing consumption of nuts throughout the United States augurs well for a better appreciation of their food value. The time when nuts were considered merely as a luxury, or as something to be eaten out of hand at odd times, is rapidly passing away. In earlier days the native hickories, butternuts, walnuts, chestnuts, pecans, and many other nuts found in the United States were to be had in country regions for the gathering and were of no commercial importance. On the other hand, the English walnuts (to give them their most common name), almonds, cocoanuts, etc., brought from other countries, were relatively expensive luxuries.

Some nuts, like the native hazelnut and beechnut, still have practically no commercial value and, though palatable, are almost never offered for sale, doubtless because they are so small and difficult to gather in quantity. The chinquapin, a small nut allied to the chestnut, finds a limited sale in southern cities, but is doubtless seldom if ever seen in other markets. In general, however, conditions have changed and our principal native nuts are now staple market commodities and bring good prices. At the same time, owing to changes in market conditions, and to the growing of foreign nuts in quantity in this country, the price of the imported nuts has dropped so that they are well within the reach of the majority.

From available statistics it appears that in 1905 the total quantity of almonds, cocoanuts, Brazil nuts, filberts, walnuts, and other nuts, shelled and unshelled, imported into the United Sates was, in round numbers, 86,238,000 pounds, with a value of $6,138,000. In 1905 the total almond crop in California reached 4,200,000 pounds, and the walnut crop, 12,800,000 pounds. The richest yield of peanuts was reported from the Southern States, chiefly Virginia, Georgia, and Tennessee, and amounted to 225,000,000 pounds.

The total quantity of home-grown

nuts, including both native and introduced varieties, must far exceed the quantities imported, but in the nature of the case no estimates of the total quantities gathered and eaten are procurable. When we consider the constantly increasing demand for nuts and the large quantity which we import from other countries, the possibilities of the industry for the American nut grower are obvious. As the use of nuts has increased, many persons have turned their attention to the growing of native and foreign nuts on a commercial scale. This work has been forwarded by the Department of Agriculture, through the Bureau of Plant Industry, and by the California, Florida, Michigan, and other agricultural experiment stations. With nuts, as with other crops, it has been found that, by selection and breeding, improved varieties are obtainable, of larger size, better flavor, thinner shells, or other desirable characteristics.

The increased demand for nuts is due in the main to two causes, namely, a better appreciation of their appetizing qualities and the numerous ways in which they form a palatable addition to the diet of the average family, and, secondly, to their use by the vegetarians and persons of similar belief—a group small in proportion to the total population, but still fairly large numerically—who use nuts, and more particularly the peanut, as a substitute for meat and other nitrogenous and fatty foods.

Even a cursory examination of the journals devoted to cookery and other branches of home economics and of the various books which are published on the subject will show the fairly general use of nuts for making soups, for stuffing poultry, for nut butters, nut salads, cakes, salted nuts, and other dishes, and indeed several volumes devoted exclusively to nut cookery have been published.

Many special nut foods, such as malted nuts, meat substitutes, etc., have been devised and extensively advertised by the manufacturers for general use in the diet and for the special needs of vegetarians and fruitarians. It is said that some of these American nut products contain soy beans, but apparently the peanut plays a very important part in their composition. In either case, since the peanut, like the soy bean, is a legume, these preparations might more properly be compared with the bean cheese and other soy-bean products, so much used in China, Japan, and other eastern countries, than with nuts, as the walnut, almond, or cocoanut.—Prof. M. E. Jaffa of California in Bulletin 332 of Department of Agriculture.

## PACKING APPLES IN WASHINGTON.

Hood River district, which really includes the White Salmon Valley, and Underwood districts, just across the Columbia, uses two sizes of boxes or rather two boxes of different dimensions but containing practically the same amount of fruit. One, known as the "special" or "California" box, measures 10 by 11 by 20 inches inside. The other, known as the "standard" or "Oregon" box, measures 10½ by 11½ by 18¼ inches inside. Each contains a little more than a bushel, (2,150.4 cubic inches). With these two boxes we pack 17 different sizes of apples for commercial purposes, so that each and every apple in each and every box arrives upon the market in absolutely perfect condition.

Ranging from the largest to the smallest these sizes run 45, 54, 64, 72, 80, 88, 96, 104, 112, 120, 128, 144, 150, 165, 175, 185 and 200 apples to the box. Some of these sizes can be packed in either box, some go only in one box. Some sizes are called "diagonal," the so-called orange pack; some "square" or "straight tier" pack. Whatever the size every apple in the box is identical in size with every other apple in that box. The number of apples contained in a box is stamped plainly on the box, each apple being wrapped in paper, a layer of cardboard placed between each layer of apples and the box lined with paper. The buyer receives from 46 to 51 pounds of fruit net, according to the size, the smaller sizes weighing most.

Not every one can become an "expert" packer, but one can learn the principle in a short time and then it is merely a matter of practice. An expert with average apples will put up an average of 60 boxes a day, for which he receives 5 cents per box for 128 size and larger, and 6 cents for sizes smaller than 128. In addition to this he is boarded by the grower.

This is the system that is the standard of perfection of all the apple growing districts in the west. The fact that we receive from 50c to $1.50 per box more than any other district in the world, is alone evidence enough that we lead in this matter. Again, at the National Apple show held at Spokane this year, the Underwood Apple Growers' Union won first premium for "Best Commercial Pack" with 39 entries. So we are not writing at random in this matter. —Green's Fruit Grower.

## THE CARE OF TREES.

Every man should be his own tree doctor. If properly trained he has been busy all summer removing suckers from the trees, fighting fungus and discouraging insects. When the leaves are all off he goes over the plantation, diagnosing each tree, shrub and bush. He will find some borers not yet killed, and these should be thoroughly eradicated from his quinces and peaches before winter sets in. Use a flexible wire and a sharp knife; and when the larvae are killed pile ashes freely around the tree . He will probably find in his currant and berry fields more or less bushes that cultivation has loosened in the soil. The ground in such case should be thoroughly packed.—Oregon Agriculturist.

An easy method of ascertaining whether one's land contains too great a degree of acidity, is to place a piece of ordinary blue litmus paper on a sample of moist soil; if the paper rapidly turns a vivid pink, it may safely be assumed that the land requires a dressing of lime. If the change of color is effected slowly, it is an indication that, while lime is needed, a light dressing will suffice. Small books of blue litmus paper may be procured from any chemist.

Los Alamitos Sugar Company continues the price of $1.25 per ton on sugar beet pulp till July 15th.

# The Aristocrat of Moderate Priced Cream Separators

**We are often asked** the reason for the great success of the

**United States Separator**

In a nut shell it is this:

***U. S. Cream Separators are made of the best material, are most thorough in skimming and most durable in wearing qualities.***

**Every UNITED STATES owner will stand back of these facts.**

**In every line there is one best.** Why? Because that one is the standard. So it is with Cream Separators, the **United States** is the **Standard Cream Separator.** Many thousands being operated in all dairy sections have established its value.

**Promises and performances.** There are cream separator manufacturers that promise great things—on paper—but in actual daily use their machines cannot fulfill their glaring claims.

**When some glib salesman** claims he has something equal to the **United States,** make him show you proof. *It is one thing to make a claim and another thing to prove it.*

**The United States has the proof.** For it ***Holds the World's Record*** for closest skimming in fifty consecutive runs, covering one month, at the Pan-American Exposition from the milk of ten different breeds of cows, a record never having been equalled.

**Before you decide** examine the **United States** carefully. Ask any of the thousands of satisfied users and get their verdict, then have a **United States** selling agent place a **United States** in your dairy on free trial and it will prove all claims.

In the meanwhile send for illustrated Catalogue No. 20

## ALFALFA.

THE first alfalfa field I ever examined with care was a small piece of ten acres on the home ranch. I came from Oakland to see the grain harvested the first year after the ranch had been bought. The beauty of the deep green field covered with purple bloom was attractive after looking over the glaring yellow of the grain lands. As I waded through its cool depths the impression of the value of the crop came to me, and with each year's experience this opinion is strengthened. On that warm July morning twenty odd years ago, after picking a boquet of the fresh cool alfalfa, I turned toward the house, passing through the corral where two cows were tethered eating dry grain hay. Their longing looks made me pause and divide the alfalfa posy between them.

At lunch I spoke of their eagerness for alfalfa only to see the tenant's wife look alarmed and say to her husband "O, Will, give the milk tonight to the pigs, I won't have the disgusting stuff in the house for the cows have had green alfalfa!" During the week I watched the way the milk and the cows were cared for and made up my mind that there were other things as well as alfalfa that made the butter bad. My mind was made up to try the good old ways of my Pennsylvania aunts, of cleanliness and care of cream, milk pans, and cows. My mind turned back to childhood days, brought other thoughts and dreams of the merry band of children playing at being King Arthur and his loyal knights, mounted on hobby horses prancing away over the daisy filled meadows in most gallant array. Surely the quest of the alfalfa was worthy of being followed, and a new purpose was born within my mind.

As soon as the ranch came into my full possession the struggle to over come alfalfa flavor began. I fed it from the start to all except one cow whose milk was reserved for the family invalid. The hobby horse humped himself to victory the first winter, and alfalfa was found to be the best of butter making food, when the cows were kept in accordance to the simple old rules of careful cleanliness, and all droppings were deodorized in the stables. This was only the beginning, however, for others had to be convinced. Did not the dairymen laugh when I first told it to them? Did not the local grocery men sneer at the idea of alfalfa making butter that could be eaten? A State Fair gold medal, won under heavy competition was the convincing stroke. The score was nearly perfect 98¾, the slight cut was hardly the fault of the butter as it was a little melted around the edges. The therometer stood at something over a hundred when the butter left Fresno at eleven o'clock in the morning and it had an all day trip up to Sacramento without ice in an ordinary express car.

Corn Also.

The Eastern agricultural press in the last few years has discovered alfalfa; now the agricultural press of of California should discover corn—Indian corn—for the two perfect the ration for domestic animals. Wherever alfalfa grows well, corn will grow fully as well. The needs of the two plants are the same; heat, moisture, and lime in the soil. Nature, that wonderful mother, supplies in the two all that cows and swine need for perfect development. The feeding of green alfalfa by grazing, as well as alfalfa hay, to hogs will make them grow rapidly into a hundred to a hundred and fifty pounds weight. At this size we have found it profitable to dress or to sell them as the additional weight above that is more costly per pound.

The use of bran, except for invalid cows and as a mash for tired horses, can be practically done away with, if there is good leafy alfalfa hay cut into inch lengths to mix with the heavy grain ration. The difference in the feeding value of alfalfa hay and bran is in a little inexpensive fat or carbohydrates, merely heat making materials. These can be supplied more cheaply by corn than by bran. Alfalfa hay stands nearly at the head of hay having most available nutriments. Vetch hay is only a trifle richer in protein, while it is again considerably richer in carbohydrates that are not particularly needed in a mild climate. What may be expected from an ordinary stand of alfalfa? I do not know on the red soil of the home ranch, but from a thirty-five acre piece of white ash land that was rented out, I received one-third the hay for five years. The one-third varied yearly from 109 tons for the lowest to 130 tons for the highest returns received by me. I do not fancy I received more than my share at any time.

The original varieties are adding new value to the alfalfa fields by lengthening out the seasons. The Turkestan promises at the Tulare station to give a larger winter growth than the present Chilean varieties grown. It should be easily within reach to find or make a variety that will grow at the same temperature that field peas make a crop. The common or Chilean variety can be trained or selected to have a shorter tap root and make a more branching root growth for the shallow soils. This at present, is one of the lacks of an alfalfa that will make a good stand on shallow soil. The Arabian seems to be one of the best for hay, as it has fine leaves and fine stalks but as it has not proven as hardy as the other varieties in the experiments made at the Colorado station, it should be sown as an experiment only in the colder portions of the great valley.

The yearly use of gypsum at the rate of two hundred pounds to the acre after the spring cutting, and the early winter use of either sifted barn yard manure or bone meal will increase the alfalfa crop greatly. It does this by making it grow more rapidly, and that makes better hay,

**Cream Separators, all sizes, all prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.**

**Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.**

for the stems are softer and more leaves are produced. Alfalfa hay must be carefully made. If it is tumbled and tossed around the leaves drop off and the greatest value is lost. There seems to be a great fear of its heating in the mow. If the hay is cut and left in the swath half a day, then raked into cocks and left another half day, hauled in and spread thinly over the top of the mow, it will come into the barn slowly enough not to heat, but be cured soft and hold the finer leaves.

The constant use of the disks, beginning the second year after the alfalfa is planted, and each time resowing the bare spots, will keep the field in good profitable condition. A thick stand will allow the plants to crowd out the poor growing ones and only the thriftiest will be left. When grown in a sparse seeding, the weak plants have a chance to grow, but are never as worthy of surviving as the plants that have to make their own way in competition. Weeds show us the value of a struggle in the strength and vitality they manifest.

The pigs and the cows are surely a winning combination when annexed to a good alfalfa pasture. Vineyards and orchards need the fertilizing elements that the stock affords. When alfalfa is fed, the nitrogen goes back again to the soil to produce more and more fertility. Behold the ceaseless round of Nature—everything fitting in, each little link to make the perfect chain. Drop one link and the chain is broken; weaken one link and the results are waste. Balance the cow and hog fed on alfalfa against the vineyard and orchard and make a farm a complete chain.

Now my hobby horse has galloped his little round and is put away for the everyday work of the ranch.—M. E. Sherman.

## ERADICATING THE CATTLE TICK.

The recent release by the United States Department of Agriculture of several counties previously quarantined on account of the cattle tick is most hopeful and encouraging to those waging war on this pest of the South. That science and hard work are co-operating to combat this terrible handicap to the southern farmer is realized in the releasing of 70,000 square miles of territory since the work was begun in 1906. The cost of the work of getting rid of ticks is insignificant compared to the losses sustained by the farmers and stockmen of the South. These come under the following heads:

Death from Texas or southern cattle fever, in and out of the quarantined district; lower prices paid for southern cattle; impoverishment of the blood caused by the ticks and consequent loss in quality and quantity of beef; greatly reduced milk production; southern breeders being barred from opportunities for sale of their animals in any but quarantined districts except under certain restrictions; expenses incurred yearly by the Federal Government and States to maintain quarantine lines.

The sum total of these losses is variously estimated at from $40,000,000 to $100,000,000 annually, which the southern farmers and stockmen in fourteen States are carrying as a burden because of the presence of the tick. A similar loss in other lines of business or crops would in all probability cause a panic in commercial circles of the states aeffcted.

As a matter of fact the cattle producers of the South have some decided natural advantages over those of the North. A longer warm season permits of greater pasture privileges, and the milder climate causes less feed to be consumed—two factors of great value in the cattle industry. With the tick out of the way the South would afford a fine field for profitable stock raising.

Numerous investigations and experiments have been conducted by which it has been conclusively proved that the cattle tick is the only natural means by which Texas or Southern fever of cattle is transmitted, and that by completely severing the relations between cattle and ticks the pests may be exterminated from any locality. But this means thorough, systematic, and persistent work in destroying ticks. If the citizens of the quarantined area will begin immediately and not permit ticks to mature on their cattle, horses, and mules, the good results to the cattle industry can hardly be calculated. They should urge their State and county authorities to take up systematically the work of tick eradication, that they may secure the co-operation of the Federal authorities and ultimately the removal of quarantine restrictions.

---

Now is the time of year that the ever present question pervading the family council is, "Where shall we go, or what shall we do this summer?" The planning and scheming period is now upon us when our thoughts turn from the sordid pursuits of city life; for man hath need of rest and he longs for the simple joys the country yields. We all wish to set aside for awhile the cares and worries of business and visit the Blessed Isles of rest and recreation.

To aid you in selecting a place for your outing or to locate your family for the summer so as to make possible week end trips, the Northwestern Pacific Railroad, the Picturesque Route of California, has issued a book called "Vacation." This book describes the garden spots and playgrounds of California in the counties of Marin, Sonoma, Mendocino, Lake and Humboldt. You can find in this book some place to suit your fancy and your purse, whether it is to fish, hunt, swim, rusticate on a farm, or visit the numerous mineral springs or resorts.

The issue of "Vacation 1909" is now ready for distribution and can be obtained from the Northwestern Pacific Railroad at the Ferry Ticket Office, the Up-town Office 874 Market St. and Room 986 (General Office) Flood Building, San Francisco, Cal.

---

A paper on "Imitation Among Animals" by Prof. Robert M. Yerkes, Assistant Professor of Comparative Phychology, Harvard University, in the July Century, has both popular and scientific timeliness. While the psychoiogists who have taken up this subject with scientific precision are cauticus as to final conclusions, their experiments are of a nature to interest the general public, and some of the results already attained are surprising. Nowhere have certain observations been carried on with greater thoroughness than at Harvard.

# Small Fruits and Vegetables

## TRANSPLANTING VEGETABLES.

MOVING plants from one locality to another is more or less of a violent operation. By the process the plant is deprived of quite a number of its feeding roots and for a time is cut off from its water supply; consequently, it is necessary to exercise considerable care with the plant until it again becomes established in the soil. To help insure this an abundant supply of moisture in the soil at all times is essential to keep the plant from wilting and incite it to take hold of the soil quickly. In sections where irrigation is practiced the transplanted plants should be irrigated immediately after setting, and frequently afterwards until danger of their drying out is passed. This can be told by the plants freshening up and starting new leaves. It is also very essential when setting the plants out, to firm the soil well around the roots. This is very important and should not be neglected. Many plants have failed on account of not doing this. Proper firming of the soil helps to exclude the air from the roots and prevents the plants from drying up.

In sections where irrigation is not practiced plants are preferably transplanted during a rainy spell. If this cannot be taken advantage of it will be necessary to water the plants by hand until they are established. When doing this do it thoroughly; a little water is sometimes nearly as bad as none.

In moving the young plants from the seed-bed to the field and until set out they should be protected from the rays of the sun to prevent wilting. This protection can be given by wrapping the roots up in a wet sack or carrying to the field in a bucket or tub with a little water in the bottom to keep the roots moist. When digging the plants out of the seed-bed, use a shovel or spade and avoid breaking off as many roots as possible. It is also better to wet the bed first. If the plants are very tall it will be well to cut off a part of the top. This operation will not hurt the plant and helps to keep it from wilting, as it prevents excessive evaporation of moisture from the plant through the leaves.

Before transplanting, the soil should be well prepared being properly fined and leveled. Plants usually take root more quickly in freshly stirred soil. After the land has been properly prepared, mark off the rows where the plants are to be set. This may be done if it is desired to plant on ridges with a plow, if on the level by a marker. One thing to keep in mind, make the rows straight and the proper distance apart. It never pays to crowd plants. By so doing a crop inferior in quality is liable to be produced. If in doubt about the proper distance to plant, consult a reliable authority or some one who has had experience.

Transplanting can nearly always be successfully done with most plants if the proper care is observed. Some of the things to keep in mind are; dig plants carefully, protect them from the sun after digging until transplanted, supply plenty of water to transplanted plants, set the plants properly in the hole, firm the soil around the roots. It will pay to carefully observe the above points when doing transplanting. Many thousands of plants are lost annually through carelessness in setting and lack of proper care afterward.—J. E. Mundell of New Mexico, College of Agriculture.

A little knowledge of plant life is of great assistance to the gardener. One should know that plants take moisture together with dissolved plant food from the soil. As the smallest roots are the only ones which can absorb moisture it will be seen that the newly transplanted plant must be at a decided disadvantage until new roots are formed. This takes several days, but in the meantime moisture is being given off by the tops all of the time, and wilting results. More water is lost on hot days than during cool weather, and if the loss of moisture is excessive, death may result. The remedy for this condition is to simply cut back the tops of plants when transplanted to correspond to the loss of root system.

Amateur gardeners often make the mistake of planting vegetables too close together. Plants having large foliage such as tomatoes, peas and beans, should be given plenty of room, in order that the sunshine may reach all parts.

# The Ornamental Garden

### THE MODERN GLADIOLUS.

EVERYBODY knows the gladiolus—in a way. It has been called "The People's Flower" because the common people can get more satisfaction out of it, without special skill or facilities, than from any other flower. As a cut flower, nothing but the expensive orchid lasts so long and no other flower has such variety and beauty of coloring.

Nevertheless, the modern gladiolus is almost unknown to a large majority of our people, because of the great improvement which has been made in a comparatively short time.

This rapid recent improvement is the more remarkable because the gladiolus has been cultivated for about a hundred years.

There are about 140 species, of which some 15 are of European and west Asian origin, a few have been discovered on the mountains of tropical Africa, but practically all our garden strains are from the south African species, variously hybridized.

I think none of the original species are in cultivation in this country unless, possibly, in botanical gardens, as all those offered for sale are the result of many crosses.

About 15 years ago H. H. Groff, of Ontario, Canada, being dissatisfied with existing strains, set out to build up, by hand crossing and selection, a strain which should have large and handsome flowers, "substance" or body of petals and especially vigor of constitution.

Many of the then existing varieties were "in-bred" and were weak. Some named sorts were selling at $1 to $3 a bulb and yet were very unproductive. He has used all strains available, including the whole of Burbank's California, and has produced a collection of (he claims) 15,000 varieties, showing the result of the many types used in their production by the wonderful variety in form, size, habit of growth, coloring and especially in the remarkable vigor and productiveness of many of the sorts.

The appearance of this strain or collection at the Pan-American Exposition in Buffalo made a sensation and has given a great impetus to the production of new seedlings by other growers.

The gladiolus is propagated by direct multiplication, by cormels, and by seeds. The corm planted dies at the end of the season, but produces a new one at the base of each shoot it sends up; so that the rapidity of multiplication depends on the number of shoots sent up.

When the corms are dug in the fall a number of bulblets or "cormels" are found attached to them. Some sorts have very few and some a great many, especially those having the Lemoine "blood." These cormels produce the same kind as the corms they are taken from and flower in the season or third year from planting—rarely the first year.

When seeds are sown they will produce hardly two sorts alike, and many will not be worth keeping, but there may be some fine new sorts. The seedlings will flower the second or third year.

It is much more satisfactory to buy the "cream" of other people's seedlings than to fill the garden with a lot of poor sorts.

Plant in full sunshine, but not against the south side of a wall, and away from the roots of trees, in well prepared soil, a mellow, sandy loam preferred, and one retentive of moisture.

Avoid contact with manure which should never be fresh and had better be plowed in the previous season or in the fall.

Occasionally restore potash to the soil in some form as for potatoes. If the soil be stiff or clayey put sandy loam in the furrow.

Plant in furrows three to five inches deep, according to the size of the corms, and the quality of the soil, and at intervals of, say, two weeks, from the time the ground will work well up to July.

By this means and by the difference in earliness of varieties, flowers may be had from July until hard frost. It is most important that the ground be kept stirred and mellow at all times, especially as soon after each rain as the ground will work well and before a crust forms.

Unless you have planted in masses for landscape effect, cut every stem as soon as the first two or three flowers open and let the buds develop in water in the house. Every morning remove the old flowers, shorten the stems and change the water. Keep at night in a cool place.

Thus treated the stems will be in bloom a week or more.

If a few specially large flowers are wanted pinch off some of the top buds at the start.

Before the ground freezes, dig the bulbs and dry them. Then cut off the stems close and store in shallow baskets or boxes in a cool, dry place. Pull off the old bulb and roots when you have time.

About watering. In my fields, cultivation has to take the place of watering, but where water is to be had, and when needed, it is a good thing if done thoroughly in the first stages of growth and again when the flower buds show color. A good soaking at the latter period makes the flowers larger.

Their varieties are legion and my space is limited. Consult a good catalogue.

About colors: The only pure white I know of is White Lady, but it has such a poor constitution that nearly all growers have given it up.

"Snow White" is often shaded pink and is a rather poor grower and a very poor producer; still it is worth growing. Augusta is the florist's white (a gandavensis), is a good grower and stem often branches. In hot weather the flowers are often tinted lavender but open white in the house. Almost the whole spike will be open at once.

Blanche (Childsi) is nearly pure-white, large and solid and about the best white as a single flower.

White Sandersoni is fine, having only a slight pink line in the throat. Snowband and Cremilda are sports of it.

Yellows are few. Isaac Buchanan (gand.) is one of the best known and rather pretty but rather small and not a bright yellow. Canary-Bird (gand.) is a good clear yellow with a good spike—the best of this color at a moderate price. Both these have small flowers.

Among Groff's Silver Trophy strain are several unnamed large yellows with a small dark spot at the throat. Klondyke is good but not very yellow. Sulphur King I have not tried.

There are no real blues, but Mr. Groff has some hybrids of Papilio Major (African) clematis, lilac and helitrope shades, with various blotches and markings, and some plum purples. Baron Hulot or Blue-jay is practically a dark blue.

For other colors see the catalogues, but I must mention a very striking sort, "Mephistopheles," bright scarlet edged yellow and with dark brown markings in the throat.—American Farm World.

**Make Money on Eucalyptus**

Growing eucalyptus is one of the most profitable industries in California today. Anybody can grow it without any culture or expense after the first year. Our seeds are selected and tested by our own expert of 20 years' local experience. A few acres of eucalyptus trees will produce an unfailing source of revenue to the owner, as the demand will always be greater than the supply.

This is the time to plant eucalyptus seed for best results.

**Special Packet Prices**

1 pkt. Corynocalyx (Sugar Gum), 10c
1 pkt. Globulus (T. Blue Gum) 10c
1 pkt. Rostrata (Red Gum) 10c
1 pkt. Tereticornis (Gray Gum) 10c
ALL FOR 25c

We can supply seeds for all varieties. Also young trees for sale. Send for circular and our 144-page seed catalogue.

**Aggeler & Musser Seed Co.**
113-115 No. Main St., Los Angeles, Cal.

**SEED**

**Melon Seed** Morris & Snow's Select Strains of Chilian, Red Seeded, Yellow Bellied and White Seeded. All of extra select stock. Some of our customers have made more money from one acre of these than from four acres of common stock as handled by others.

**Casabas** also. Improved Hybrid, Summer and Winter, all from select stock. Get our prices and make a trial. We also have a select strain of **Gautier's Pineapple.** All selected from perfect melons and not from leavings, as is customary among many. **Vegetable and Flower Seed** of select strains. Our "High Quality," "Full of Life" Seeds are winning for us wherever tried.

**Eucalyptus** All the Leading Varieties in seed @ 15c per package. ( Six of the leading varieties, E. Rostrata, E. Leucoxylon, E. Rudis, E. Globulus, E. Corynocalyx, and E. Tereticornis for 50c, with cultural directions). 500,000 Plants. all varieties. State your wants and get prices.

**Send for Our Spring Catalogue**

**MORRIS & SNOW SEED CO.** 425 So. Main Street Los Angeles, Cal.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 22, 23.

### ALFALFA.

It is strange that it has been necessary to wait so many years to determine the full value of California's principal forage plant. Farmers who have used it have invariably said, "O yes, it is good, a very valuable plant." But appreciation of its full worth has not been shown until the past few years, if even yet it is fully appreciated. Of course, it goes without saying that its success has been greater in California, or at least in the Coast states, than it has in the East, though there it has been cultivated longer. As may be seen on the first page of the cover this week, one field is now growing in North Carolina which has been planted seventy-five years. The most enthusiastic friend of alfalfa in the Middle West is Mr. Coburn of Kansas. His recent book on alfalfa gives to it all kinds of praise and urges its more extensive planting in the eastern states.

It grows in practically all sections of the world. It is not particular as to soil; not extremely exacting as to water, for it, produces without irrigation fairly good crops where the rainfall totals fourteen inches, also in the Gulf States where it totals sixty-five inches. It produces well at an elevation of 8000 feet; and does magnificently in sections 200 feet below sea level. It does fairly well in sections as far north as Vermont, though, of course, its greatest yields are in southern states.

In addition to the immense tonnage which it gives, the feed is exceptionally rich in protein, more so than any other crop which will in any way compare with it in total yield. Its leaves, as stated on another page, are even richer in protein than is bran.

In order to secure information as to the best methods of handling alfalfa in California, the Cultivator has written to growers in various parts of this state and of Arizona, asking as to methods of cultivation and harvesting. Part of these answers will be found on the first pages of this week's issue, and, owing to the interest in the subject, these will be continued in next week's paper, even more answers appearing in that issue than in the present one.

We thank our contributors who have sent in answers to the questions and believe they will be appreciated, and we aore sure that our subscribers who are interested in alfalfa will derive great benefit from these articles.

### BIG AS SEVERAL BOOKS.

Our observing subscribers may have noticed that last week's paper completed Volume XXXII. They may also have noted that the number of pages totalled 728 for the six months covered by the volume. Seven hundred and twenty-eight pages of the size of the Cultivator would makc several books of the ordinary library size, and yet the total cost to our subscribers is only a matter of four bits. We do not believe any farm paper of the West gives any such amount of reading matter for such a sum.

True it must be admitted that bulk is not the entire consideration in reading matter, but as regards quality we may be permitted to call attention to the fact that much of the material which has appeared in the Cultivator for the past few months has been furnished by practical hard-headed producers, engaged in agricultural work in the state. The Cultivator boasts that most of its material is thus secured, and we believe that none of greater value can be obtained than from the producer who has tested out his own methods. Of course in saying this, we are not referring to literary merit, merely to practical information given by practical people.

That this information has been appreciated by our large family of subscribers is shown by the increasing circulation. More papers are issued today from the Cultivator office than ever before, and, we believe, more than from any other farm paper west of the Rockies.

As to Volume XXXIII, which begins with this number, we make no promises other than to say that we propose to continue to secure from practical workers the same class of ideas which we have in the past, and we ask the co-operation of our subscribers to that end. Help us to make the paper better every week.

### IT DON'T PAY.

The great blight that today is paralyzing the agricultural interests of this country is ignorant and wasteful farming. It is destroying the fertility and natural resources of the country. What we need is intelligent, energetic, educated farmers and managers. There never was a time when the demand for competent farmers and managers was as great as it is today, nor a time when qualified men could command as high a salary as they can today. We ought to assist, educate and instruct the farmer in the improved and modern methods of farming, and of rearing, feeding and improving his cattle. We ought to encourage, and persuade him to give his sons a thorough agricultural education. Then they will want to stay upon, and manage the farm, instead of abandoning it to obtain some ill paid position in the village or city. Then they will learn the chemistry of their soils, and will know what to put upon their lands to obtain the best results from the various crops they desire to produce.—President Kellogg of the Holstein-Fresian Association.

### A GOOD EXPOSITION.

The California Promotion Committee, referring to the recent California excursion to the A-Y-P Exposition, says that the eyes of all attending the exposition have been opened to the wonderful possibilities for good in this great educational exhibit. The Committee adds that the exhibits equal those of any exposition ever held, and that everyone that visits it cannot fail to return with a higher sentiment of loyalty to his country and of pride in his state. Especially is this true of Californians who have the finest state building on the grounds.

### PRACTICAL ALFALFA METHODS.

(Continued from Page 3.)

to plow up the field and sow to something else for a while.

10. I think it best to keep a field in alfalfa as long as it is a good, clean stand and sufficiently thick to grow fair crops.

11. I have never grown alfalfa between orchard trees.

12. I raise alfalfa to feed dairy cows. I am satisfied it makes the best hay for this purpose if cut as soon as it gets into the bloom bud, before it gets into bloom. There will be an occasional bloom seen through the field by the time it is all in bud, but it should be cut before there is any very noticeable amount of bloom.

As to time of raking after cutting, that depends largely on weather conditions. In the hottest weather I sometimes rake four or five hours after cutting. This question cannot be definitely answered, as conditions are rarely the same in two consecutive cuttings. The weather must be taken into account, and also whether crop is light or heavy. The hay should be raked, cocked up and cured in the cock, and should be stacked before it gets dry enough to lose the leaves in handling. It shatters badly when too dry and the stalks after the leaves are gone are not of very high value. The hay should be put into the stack as soon as it will keep without heating. It should be damp enough to go through a light sweat and will thus handle much better when fed out. I have never used caps of cloth for covering the cocks, nor have I ever heard of them being used in California.

**Tribble Bros., Elk Grove, Sacramento County.**

1. We grow the common alfalfa or Medicago sativa. We are securing seed of the Arabian variety.

2. We irrigate from a gasoline pumping plant and have our checks high enough to have water three inches deep on the highest parts of each square.

3. We plow and harrow till the earth is all pulverized, no clods or lumps remaining, and have never inoculated our soil.

4. We sow any time our ground is ready except during the winter. After ground is in condition we sow the seed and flood the ground and keep it so the moisture can be seen on the surfaoe till the alfalfa is several inches high. We have used from twenty to twenty-five pounds but that is more than necessary as our plots stand very thick. We seed by broadcasting and test the seed for dodder before buying, but have got a start of sweet clover in our last plot. We sow the seed alone and believe any grain sown with alfalfa is injurious.

5. We tried disking but ruined the alfalfa and now use a sharp toothed harrow, which has proven much better. If used three times a year it would pay. We use stable or barnyard manure, all we can get, and get at least two-thirds more hay or green feed than from the unfertilized plots.

6. The first cutting is usually somewhat foul, but not much so, and only a small amount of foxtail. We do not have a silo but use the feed green.

7. We cut seven or eight times a year.

8. Feed it on the place and allow no pasturing, under any conditions, and are not troubled with bloat.

9. Gophers are our only pest and they are drowned in irrigating.

10. The alfalfa is allowed to stand for years. After five years in two plots, it is even better this season than any year previous, owing to a good dressing of manure.

11. We do not grow alfalfa among trees, but a fine bearing walnut orchard near here has been ruined by planting alfalfa in it. In irrigating, alfalfa takes more water than any fruit tree can stand (fig excepted). If alfalfa was not fertilized it would soon exhaust the soil. Such being the case, trees would be injured.

12. We cut just before the blossoms open. In curing we rake on the day following mowing, and judge from the appearance in the cock when to haul. We usually turn cocks over so they may dry evenly. We have never had occasion to use caps.

* * * *

Owing to the large number of answers, and all most interesting, the article will be continued next week.

# Agricultural Notes of the Pacific Coast

## Northern California

Oroville reports a heavy olive crop.

Prune trees are being thinned near Oroville.

Interest in the dairy industry is increasing in Sutter county.

Auburn, Placer county, is soon to have a carnation nursery.

Vacaville has a new co-operative fruit marketing association.

The cannery at Haywards is paying $25 per green ton for apricots.

A rain last week over the Sacramento Valley did some little damage.

Sacramento is shipping about twelve carloads of vegetables daily.

Meridian, Sutter county, reports an exceptionally fine crop of hay and grain.

The recent rains caused grape growers to do much extra sulphuring of vines.

The depth of snow about Lake Tahoe was so great this year that the season of opening was much later than usual.

Hop growers of the Sacramento Valley are anticipating that hops will yet go to fifteen cents a pound and possibly twenty.

The hay and grain crops of Humboldt county will be light, but the fruit crop heavy.

Skimming station No. 1 of the United Creameries Company, located at Arcata, Humboldt county, recently burned.

The foliage of peach trees near Palermo is being attacked by a beetle which is said to be very seriously damaging the trees.

A frightened team of thirty-two horses scattered a combined harvester over several acres of ground at Williams, Colusa county.

The members of the Sonoma County Co-operative Poultry Association have changed to a monthly meeting held regularly on the first Saturday of each month.

Notwithstanding there has been some development in Mexico in the dairy industry, the bulk of the butter used by Americans there is supplied from this country.

Vacaville shipped a car of peaches, plums and apricots to the Philippines a couple of weeks since. This is the first full car ever shipped to those islands from California.

The Colusa Water Carnival held the third week in June was a grand success from every viewpoint. The Sacramento Valley Development Association is doing splendid work.

A poor fence was the cause of a large number of horses from a ranch in Biggs, Butte county, escaping to the railroad track, and the Oregon Express plunged into the bunch and killed seventeen.

Among the live stock exhibits at the Alaska-Yukon-Pacific Exposition, we note that Mrs. J. H. Glide, Sacramento, will take her large herd of shorthorn cattle, among which is Edward III, winner of many prizes at many fairs and expositions: T. B. Gibson, Woodland, will also take a herd of shorthorn cattle; Senator B. F. Rush, Suisun, will also take a herd of cattle; H. P. Eakle, Woodland, will take some sheep to enter in competition for prizes.

## Central California

English capital is investing in vineyards near Fresno.

Fresno county produces over $3,000,000 worth of cereals yearly.

Six sections of land were covered by fire near Famoso, Kern county, last week.

A fine boulevard is to be constructed from Del Monte to Castroville, Monterey county.

Co-operative life and fire insurance was the topic at a recent meeting of the San Jose Grange.

The directors of the Santa Clara Valley fruit growers' Association have filed with the secretary of state articles of incorporation.

George Smith of Corcoran will exhibit over $50,000 worth of Jersey cattle at the Seattle Exposition.

San Jose Grange has asked congress through Representative Hayes to put a tariff of two cents a pound on cherries.

Raisin growers of Fresno county are making an effort to have the raisin introduced as a part of the army ration.

George Smith's Creamery at Corcoran is said to be running about 1200 pounds daily. It is all shipped to Los Angeles.

Lincoln Grange, Santa Clara county, is starting a movement to secure less automobile speeding on the public highways.

The first eastern shipment of plums out of Santa Clara Valley was on June 18th and consisted of eighty-five crates of Clymans.

Santa Clara Valley Chamber of Commerce has just issued 25,000 booklets showing the horticultural possibilities of that section.

Twenty-seventh annual exhibition of the Monterey Agricultural Association will be held at Agricultural Park, Salinas, August 16th and 17th.

San Jose is to have a special day at the Seattle Exposition, and proposes to make known the merits of prunes on that day as never before.

At the recent meeting of the directors of the Bakersfield Fair Association it was decided to hold the coming fair the week following the State Fair in September.

Prof. W. H. Volck working in the apple orchards of the Pajaro Valley has made investigations which will be of great value to all apple growers who have been troubled with powdery mildew.

The directors of the Santa Clara Fruit Association have taken up the matter of the handling of the coming output of fruit and are arranging with a prominent fruit man to act as manager of the central organization.

The grape growers of Turlock have pledged themselves to contribute ten cents for each ton of grapes sold during the coming year, to be used as an educational fund in the distribution of literature concerning the wine industry.

Report having been published that the Argentine ant had taken possession of Delano, Kern county, fruit growers there have come forward with denial that such was the case, and state that the ant in question was merely the ordinary red ant.

## Southern California

Redlands will dry 1000 tons of apricots this season.

Imperial farmers are planting heavily of Egyptian corn.

Corona has a young orange nursery of over 300,000 trees.

The Oxnard Sugar Factory will begin its campaign on July 6th.

Apricot dryers started full handed in the Redlands district last week.

A large addition is being made to the fruit packing house at Banning.

The first full car of cantaloupes out of Imperial commanded $2896 in New York.

Coachella Valley claims to produce dates which are the finest in the world.

Carload shipments of cantaloupes are now at their height in Imperial Valley.

It is feared the hot weather at the first of June has injured the coming olive crop.

An Oxnard grain grower has a freak barley which grows five heads on a single stalk.

Desert papers are recommending the use of mesquite for shade trees along the roadways.

The Imperial Valley Collegiate Institute at Heber will soon begin the erection of a $13,000 building.

Yucaipe Valley, San Bernardino county, orchards are setting an exceptionally heavy crop of apples.

The horticultural commission of Riverside county is doing some thorough work in gassing orchards infested with red scale.

Garden Grove, Orange county, has had a bumper crop of berries this year. The fruit is marketed principally in Los Angeles.

It is estimated that the increase of the water supply of San Jacinto from this season's developments will be about 600 miner's inches.

While it was supposed that the navels were practically all shipped by June, it is said that a few were forwarded as late as the first of July.

Beaumont, San Bernardino county, has proved itself a cherry growing section by shipping for a short time this year two tons of cherries per day.

During the highest of the flood of the Colorado River, it was estimated that it was discharging about 120,000 cubic feet of water per second, which was about equal to 6,000,000 miner's inches.

Mr. J. B. Neff of Anaheim, who has grafted his walnut orchard to blight resistant stock, has found some grafts set last year bearing as much fruit this year as the entire tree bore before it was grafted.

The ranchers and truck growers of the Coachella and Imperial Valleys have formed an organization which it is hoped will lead to a stock company which will build cold storage houses and market the products of the members.

Los Angeles recently shipped six cars of potatoes within one week to the northern markets. Shipments have usually been the other way, and this anomaly is said to have been caused by the late spring frosts along the Sacramento and San Joaquin rivers.

## The Coast

Alfalfa is selling in Spokane at $20 per ton.

Saint Maries, Idaho, is soon to have a creamery.

Yuma Valley, Arizona, barley crop will be immense.

Union, Oregon, shipped 148 carloads of hay last year.

New alfalfa started off at Seattle, Washington, at $13 per ton.

700 cars of fruit will be shipped from the Yakima Valley this summer.

Grain fields about Tequoa, Washington, are expected to yield 40 bushels of wheat per acre.

Hood River apple growing section maintains that it will ship a thousand cars more apples this year than last.

Palouse, Washington, farmers' union will incorporate and handle grain of its members and do a warehouse business.

The Pierce county, Washington, Bee Keepers' Association recently held its annual meeting and elected officers.

The farmers' union of Medical Lake, Washington, recently held a picnic at which over 215 people were present.

Lebanon, Oregon, recently held an all day strawberry fair, the prize crate from which sold for $33 for twelve boxes.

The Idaho output of prunes will be small this summer, but the Washington and Oregon estimates are fully up to the average.

It is estimated that the grain output of Walla Walla county, Washington, will aggregate about 5,000,000 bushels this season.

Alfalfa growers at Pullman, Washington, began their first cutting of alfalfa about the middle of June. The yield will be immense.

Sheep owners at Pendleton, Oregon, have been arrested for failure to dip sheep. The inspectors declare that clean sheep must be the rule.

A strawberry grower at Arlington, Oregon, has one vine on which 140 berries were counted at one time. This count did not include blooms.

The underflow of Santa Cruz and Rillito rivers in Pima county, Arizona, will be captured and used for irrigation of large sections of dry land.

A meat packing house is proposed for Yuma. The only point to be considered now is as to whether the supply of live stock will be sufficient to maintain it.

Coeur d'Alene is preparing to accommodate immense crowds of visitors expected during the registration for the opening of Indian reservation lands July 15th to August 9th.

Eighteen sections of land near the headquarters of the Nachez River near Yakima, Wash., have been withdrawn from entry. The irrigation project contemplated is the cause of the withdrawal.

A proposition will be made at the coming irrigation congress to be held at Spokane August 9th to 14th that Congress be memorialized to issue gold bonds running a hundred years in the amount of $5,000,000,000 for reclamation and conservation of various resources.

Prospects are good for an exceptionally large crop of Tokay grapes at Folsom and Fairoaks.

# Profit in the Poultry Yard

By Mrs. Frank Metcalf

**We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.**

### ALMOST WENT LOONY.

I SAID to Arabell—Arabell is my daughter—that I was going into the chicken business, if I had to ruste them in the kitchen; and so we did.

I bought an old hen from old Missus Jones, and gave her 35 cents for the bird. Well, Mrs. Blackwell, the person Arabell was working for, mean, stingy old cat, gave to Arabell nine setten eggs. But as luck would have it, every egg hatched, and the old hen made a good mother to the little chicks.

Now, we set the hen in the kitchen, and when the chicks came, we were no better off than at first; for we had no pens to put them in, so a store box was put on the side poarch where the sun came and—well, I never saw chicks grow so fast; It was only a few weeks until the billy-boys were fighting each other, and they actually crowed for joy as the battle turminated! Well, Mr. Blackwell, Arabell's lady's husband, pursuaded Arabell to take his incubator and raise more chicks. He, good man that he is, made Arabell a present of six dozen eggs—so there was no getting out of it; we were in for the Chicken business, and no mistake, even if we had to ruste them in the kitchen.

Well, now six dozen little chicks to mother was more than I had reckined upon; so the side-porch had to be wired in and a bruder attached! my grecious, I thought I would go wild with all the cherping, from early morning till night!

Then Arabell, she got her wages, and she would have made chicken-runs, and little ruste houses in the garden, so all my nice garden vegetables had to give place to the Chicken Business. Well, we actually had 81 chickens, and the crowers sold for enough to pay for all the wiring and rustehouses.

But, if Jim Fisk had not taken Arabell, and the chickens too, I should have gone loony, sure.—Mrs. Pepper.

### TURKEYS.

A TURKEY will succumb to most any disease, if infested with vermin, as the system is already weakened and they haven't the strength to resist them. If gorged or overfed while young, it causes a diseased liver, which results in bowel trouble and usually ends in death, or, if the poult should recover, it always remains a puny, stunted turkey, and one would much rather it was dead. Turkeys while young, easily contract disease from other fowls. For this and other reasons they should not be allowed to run with other poultry, until they are older and stronger.

Nothing keeps a turkey in good health so much as free range. They must have free range to grow and develop. We were once asked how much free range ought a turkey to have. Our answer was that an 80-acre farm was none too much and then, sometimes, they trespass on a neighbor's 80, which frequently causes an outbreak of a well known disease called "bad blood," in which more than the turkey are affected. In this case you probably will have a remedy of your own. All dead animals, or fowls, should be promptly burned or deeply buried, as in all dead bodies ptomaine poison develops and if eaten by turkeys, it causes paralysis of the nerves or "limber neck" as it is usually called for which there are very few remedies. Anything that will stimulate the nerves may save them. It is probably a well known fact that a fowl does not perspire, the waste of the system in a large measure being carried off in the vapor of the breath, which is far more rapid than many would suppose. The heart of a turkey beats 150 times per minute, which causes a rapid respiration and demands twice the amount of air, in proportion to its weight. Thus it will be clearly seen how very great is the demand for fresh air during their sleeping hours. We have seen turkeys that were taught to go in the poultry house and roost with the chickens, but they were not as strong, healthy turkeys as those that were allowed to roost in the open air, on trees or fences, both winter and summer. Possibly they may live, but we want them thrifty as well.

The term, "cholera" is applied to a disease which, though it varies in different parts of the country, is everywhere accompanied by a violent diarrhoea and is rapidly fatal. In such an outbreak among your turkeys separate the sick ones from the well, and at once give a change of food, which should be of the most nutritious character, combined with some stimulant, as ginger or cayenne pepper or a tonic of iron put in the drinking water.

Turpentine put in the drinking water of the well ones acts as a disinfectant and prevents the disease from spreading.

A continual feeding of corn with the lack of grit or coarse sand, will sometimes cause an outbreak of this trouble, which attacks the whole flock in general. The disease appears to be epidemic, but with a variety of food with plenty of grit, this so-called "cholera" very seldom makes its appearance. A subscriber writes that she has turkeys that have swollen heads and would like to know if this is a germ disease and how long it will take to stamp it out. This disease may be caused from germs as there are very few diseases that do not originate from germs, bacilli, or in some microbe form, and unless it is fully developed, it can be stamped out with very simple remedies. In common words, this swollen head is nothing more or less than cold, caused mostly from exposure, and is the first symptom of roup, one of the most formidable diseases we have. If taken in its first stages it is quite easy to control, but if allowed to develop is one of the hardest to contend with. At first they begin by sneezing and their heads swell. To neglect this trouble at this stage would result in roup in a short time. The membrane of the air passage, tear tubes and throat becomes inflamed and when so much so as to close the air tube, the discharge be-

comes acrid and roup is the result. To prevent this, it is necessary to check these mucous discharges.

We found that turpentine rubbed on the neck and head, swabbing the throat with the same, acted as a counter-irritant, and worked like magic, demonstrating the fact that this disease could be checked in its first stages by a very simple remedy.

### Raising Turkeys.

We prefer setting turkey eggs under some motherly hen whose brooding qualities are assured says a correspondent to the "National Stockman." The turkey hen is of too strolling a disposition. Twenty-seven days are required for incubation. If the weather is warm no especial care is necessary during the time the ben leaves the nest to seek food; but care must be taken lest they chill should the weather be cold. The best time for hatching is May if it can be managed, especially if the birds are wanted for the Thanksgiving market. Eleven eggs may safely be given to a large fluffy hen, but nine are enough for an ordinary sized hen.

As soon as the poults are hatched, which is all about the same time—being much more uniform in this respect than chicks—remove with their mother to a new coop if possible. Let it be warm and rain proof; one with a southern front is best, as it will admit both sun and air on pleasant days. A storm door must be provided for rainy days. If the coop has been used before thoroughly fumigate and whitewash it. Select an elevated, well drained place. Confine them five days, when they may be allowed to go out for an hour or so; but do not allow them to become tired out. Visit each coop every evening and see that every chick is covered by the hen—many fatalities arise from this cause—the silly things will chill within a foot of the hen, so during the first few days watch them closely. During the first few weeks they should be fed at least five times a day, and only what will be eaten up clean, using saucers or shallow dishes for this purpose.—Green's Fruit Grower.

You can't expect to keep pills and capture the cups.

Zetetic method will bring results where blind following of custom fails. —Orffs Poultry Review.

### PROVIDE FOR POULTRY.

To the average farmer the income from poultry appears insignificant and not deserving of any especial attention from the head of the farm, says the Farmer's Advocate. Of all places for the handling of poultry at a profit the farm is ideal. Farm life provides the natural environment for the laying hen and the growing chick. While picking up the waste of the farm the hen gets the food best adapted to her requirements; she gets the exercise needed and the free range gives her the clean quarters and pure air she must have to be healthy and thriving. In proportion to live stock on the farm she needs the least special attention and in reality almost every dollar of income is clear profit. It is the duty of the farmer to provide during the few months of the year needed a comfortable and healthy hen-house and to provide such feed as is needed by the flock during the winter. Everything else can be taken care of by the wife and children, and knowing as they do the value of the poultry product, they are glad to bend their energies to increasing the income.

The eggs from many farms buy all the necessities of the house and in many instances the boots and shoes for the boys and girls. Every farm should have all the hens thereon which can be accommodated, and it is safe to say that on nine of every ten farms two or three times as many could be kept as at present. If you have not kept an account of the income from poultry, begin that account now and note if at the end of the year you do not feel justified in increasing the flock and in giving more of your time in providing the women with better facilities for housing and feeding.

Coulson's
EGG FOOD

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

## DESERT WATERING PLACES.

THE southwestern part of the Great Basin—that portion of it including the arid areas of southeastern California and those of Nevada that are most easily reached from California points—is known generally to the dwellers in the less arid districts west of the Sierra as "the desert," but local names are applied to its various subdivisions. The most important of the subdivisions are the Colorado and Mohave deserts and the Death Valley region. The Colorado Desert extends from San Gorgonio Pass southward to the Gulf of California and includes the depression known as the "Salton Sink." The Mohave Desert lies farther north and its boundaries are not so definite, but it includes much the greater part of San Bernardino County and the eastern portions of Los Angeles and Kern counties, Cal. The Death Valley region, which lies north of Mohave Desert, stretches eastward from the Sierra Nevada, covering a large part of Inyo County, Cal., and extending into Nevada. It is named from its central feature, Death Valley, the lowest point on the continent.

### Resources Of The Desert.

The present public interest in this desert region, which comprises an area of about 68,000 square miles, is intense, largely because of the discovery and development within it of mines that are heavy producers of gold. The resources of the desert, however, are not confined to the precious metals but include many other products of economic value, among which may be mentioned several valuable salts, including borax, soda, gypsum and common salt; building material, including marble, onyx, brick clays and cements; baser metals like copper iron, and lead; and gems, among which are turquoise and opal. These products are widely distributed throughout the desert counties, and although the existence of some of them in commercial quantities and available form is as yet problematic, others already form the basis of important industries.

### Wells And Springs.

The wells and springs of the desert region are few in number and very irregularly distributed—so irregularly, indeed, that although in some districts watering places occur in groups, in others they are 30 to 50 miles apart. Unusual activity in railroad work has so stimulated prospecting that there is a large influx of strangers, many of whom do not fully realize the danger of traveling through an arid region, and it is highly important that the springs and other watering places should be located as definitely as possible and described for the benefit of prospectors and other travelers. It is believed that this urgent need for the dissemination of information in regard to the location of known watering places and the possibility of locating and developing water at other favorable points will be met in part by a report by W. C. Mendenhall, which has just been issued by the United States Geological Survey as Water Supply Paper 224. The paper includes a map of the region.

More than 300 watering places are described and mapped, and the map shows also a number of the principal roads through the desert. These roads have not been surveyed and only approximate locations are possible, but the map at least indicates the usual routes of travel.

A copy of Mr. Mendenhall's report can be obtained on application to the Director, Geological Survey, Washington, D. C.

## PROGRESS OF THE IRON CANYON MOVEMENT.

THE effort to bring about the construction by the United States Reclamation Service of the Iron Canyon project is progressing in a manner highly satisfactory to those interested. Application for actual construction was made to the Secretary of the Interior in February last, and resulted in an allotment being made for surveys to determine the feasibility and cost of the works. Following this was a mass meeting at Red Bluff of large proportions and unbounded enthusiasm.

The surveys have not yet been begun, but it is believed that they will be in progress soon. These are expected to determine the feasibility and practicability of the project and the approximate cost, and to form a practical basis upon which the proposed works may be considered by the officials of the Department of the Interior and by the owners of lands to be irrigated.

It is reported that Secretary of the Interior Ballinger will visit the Pacific Coast next fall, and an effort will be made to induce him to spend enough time in this valley to become familiar with the principal features of the project, and with the great advantages of the lands available to the Iron Canyon site.

The letter of Secretary Garfield, written in response to the application for construction of the project, constitutes a most important recognition of the proposed project. It states that the Sacramento Valley project is of national importance; that it is the intention of the Department to proceed with its construction as funds become available; that Iron Canyon is regarded as "the dominant unit"; that an allotment for surveys has been made.

The Iron Canyon project involves the diversion of the Sacramento River at Iron Canyon, seven miles above Red Bluff, and the distribution of the waters to lands lying on both sides of the river below that point. The application was made on behalf of a unit of approximately 120,000 acres (probably about one-third of the area to be served ultimately), of which about 100,000 acres were actually represented by signatures attached to the petition. The signatures to this petition were obtained within a period of a few days. When it was decided to present the matter to the Department, committees took it up actively and effectively. The results already shown at Orland, where a project is under construction, had paved the way to ready organization; every land owner who was approached signed the application. It was a demonstration of an interest in irrigation and confidence in the Reclamation Service.

Money for the construction of this project is not available in the reclamation fund, but it is hoped that means will be found at no distant date. Accessions to the fund amount to more than seven millions of dollars annually, and if they continue at this rate the money will become available. It is possible too that other means may be found. It has been suggested several times that land owners and States may co-operate with the Reclamation Service in financing irrigation work. This is now being done in a small way, and a larger development along these lines is wholly possible.

The most encouraging feature of the situation with reference to the Iron Canyon project is the interest taken in it by those whose interest is essential to its realization. It is a well known fact that the Reclamation Service was kept out of this valley five years ago by the apathy of the people. Now that there has been a real awakening it is safe to assert that a large development is in prospect.—Great West.

## FOURTH DRY FARMING CONGRESS.

The Fourth Dry Farming Congress will meet at Billings, Mont., October 26, 27 and 28, 1909. The International Exposition of Dry Farm Products will be held during Congress week at Billings. Thirteen western states and territories, two Canadian provinces, Mexico and Russia will send exhibits. Seventeen states and ten foreign counties will have delegates at this Congress.

In the west 200,000,000 acres of arable land awaits development by Dry Farming methods. Texas has 25,000,000; Montana, Colorado and Wyoming, 50,000,000; New Mexico, Oklahoma, Utah, Idaho and Arizona, over 60,000,000.

Experts estimate that in ten years every drop of water available for irrigation will be utilized. For every acre irrigated there will be 50 acres of dry farm land when irrigation possibilities are exhausted. Experience shows that non-irrigable land yields crops averaging 50 per cent the quantity reaped under irrigation. To this land the future homeseeker must come.

In 1900 dry farm land in the west averaged fifty cents to $1.50 an acre. Increased valuation where Dry Farming has been demonstrated shows that within ten years this 200,000,000 acres will be held at $10 to $50 an acre. Dry Farming means an increase in western land values, at a conservative estimate, of approximately five billion dollars.

The Dry Farming Congress teaches farmers how to conserve moisture by intelligent cultivation, educates them in soil culture and seed selection and guides inexperienced settlers in methods that bring them their share of the harvest profit. It extends the limit of producing area to the limit of acreage in arid and semi-arid regions and, therefore, is the keystone upon which the future prosperity of the great west is established.

## THE DISK IMPLEMENTS.

THE disk which is now being used on many of our farm implements has certainly come to stay. Its rolling friction makes it pull somewhat easier than sliding friction. Because of its rolling motion and cutting effect, it is very hard to clog; what it cannot cut it will roll over.

### Disk Plow.

The disk plow is capable of handling ground that has become too dry and hard for the moldboard plow. It is of somewhat lighter draft, does not require sharpening so often, cuts through trash better, and does not clog so easily.

The 24-inch disk is superior to any other size. This size will pulverize the soil more than a 28 or 30-inch one and does better work.

The disk should not cut too wide a furrow. It is far better to use two disks 24 inches in diameter, each cutting 8 inches in width, than to use a 30-inch disk, cutting 14 to 16 inches in width. Taking a narrow furrow tends to make the bottom of the furrow less corrugated.

Plowing the same ground year after year with the disk does not keep it in so good condition as if plowed with a moldboard plow.

The moldboard is generally considered best for humid and irrigated sections, and the disk plow for dry, semi-arid sections.

### Disk Harrows.

The disk harrow may be considered as the most important tillage tool for grain farming. There is no other tool that will conserve more moisture by using it on stubble, after harvest and before plowing time. It may be used as a cultivator for summer fallowing. On ground where small grains are to follow such crops as beets or potatoes, the use of this tool will often make plowing unnecessary.

The 16-inch disk is the proper size for ordinary farm work. This size pulls somewhat heavier than the larger sizes, but pulverizes enough better to justify its use. The 16-inch disk penetrates the soil deeper than the larger one because it has less bearing-up surface; it revolves faster, thus pulverizing the soil better.

For handiness and ease of operation each gang of the disk should be controlled by an individual lever. All bearings should be well protected from dust and dirt and so constructed as to be easily oiled. Each disk should be provided with a satisfactory foot lever cleaner.

### Disk Grain Drills.

Of the various methods of opening the furrows on grain drills, the disk is now given the preference. This may be either in the form of a single or a double disk. The single disk is being used very much more than the double disk at present; it penetrates the ground easier, cuts through the trash better, and is capable of cutting a deeper furrow than the double disk.

The double disk has the advantage of being able to deposit the seed in a better condition, to a more nearly uniform depth, and also leaves the ground smoother. There is very little difference in the draft of these two types of disks and under ordinary conditions very little preference between them.—H. M. Bainer, Colorado Agricultural College.

## THE FIRST CUTTING OF ALFALFA.

All alfalfa should be cut when not more than one-tenth of the plants have come in bloom. Cut at this early stage the yield of hay for the season will be much greater than if it is cut near maturity and every pound of hay secured will be worth more for feed. Early cuttings invigorate the plant. The late cutting of the first crop injures the plant more than any other time and we have found it profitable to cut alfalfa as soon as new buds appear around the crown regardless of the bloom. The increased yield from succeeding cuttings over that cut late much more than makes up for the loss of the first crop.

The leaves of alfalfa contain more than three times as much protein as the stems. A ton of alfalfa leaves contains as much protein as 2,800 pounds of bran. Protein is the material necessary for the formation of blood, lean meat and milk. Every effort then should be made to cure the alfalfa in such way as to save all the leaves possible. The method of curing will of course vary with the condition of the crop, ground and weather. When alfalfa has made slow growth and at the time of cutting the ground and the weather are dry, there is no difficulty in curing. Often under these conditions it is safe to rake within a few hours after mowing and stack a few hours after the alfalfa has been put in the windrows.

When alfalfa has made rapid growth and is rank and succulent, and the weather and ground are damp the problem of curing is a difficult one. It is easy to dry the leaves but the stems will contain much moisture after the leaves are too dry. Alfalfa hay should become so dry before stacking that when a handful of stems are tightly twisted together no water can be squeezed out. The most practical way to accomplish this and at the same time save the leaves is the plan to adopt and this will vary with different seasons and places. There is practically no difficulty in this country in curing any but the first crop.

Some of our alfalfa growers in Colorado make a sandwich by putting alfalfa and dry straw in alternate layers. This is a satisfactory way if the dry material is available. Others use from ten to fifteen pounds of salt or airslaked lime for each ton of hay, sprinkling the salt or lime so as to cover as much of each load as possible. However, we have noticed that less gain is made by cattle when salt is mixed with the feed. Lime showed little effect and we have never thought much of its use in this way. The best way to prevent spontaneous combustions of alfalfa is to thoroughly cure before stacking. It is not often that all the conditions necessary to produce spontaneous combustion are present and ordinarily there is no danger when reasonable care is taken, except with the first cutting and then only when the growth is rank—Denver Field and Farm.

# Queries and Replies

**Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### This Year's Dried Apricots.

What is the ratio between the amount of dried apricots this year and last?—A. G., Santa Paula.

It is impossible to give the ratio at this time. We can say, of course, that the crop is much larger this year than it was last, although it is not up to the normal full crop. In fact, some think we will never reach the total output we had a few years ago owing to the fact that so many orchards have been removed. So far as returns have come in the fruit this year shows exceptional quality.

### Various Questions.

When should a three year old umbrella be moved? Would mammoth blackberries ship 100 miles and be in marketable condition? Burbank's Phenomenal berry does not yield here nor grow so large as in some other localities. How is it generally?—J. A. P., Ripon.

Move the umbrella tree between January 1st and March 1st.

Certainly blackberries could be shipped 100 miles and arrive in good condition. That would only be a little over three hours.

I know of no fruit ever sent out that gave so many unfavorable reports as the berry you refer to. Unreliable parties have sent logan berries often for Phenomenal and possibly the latter is all right if you get it true.—Q. A. L.

### Size of Apricot Boxes.

A Ventura subscriber recently asked concerning size of boxes in which apricots are put when given to the cutters in the dry yards. He reports a great diversity of size but practical uniformity of price for the cutting. The box generally used is the so-called fifty pound box. He wishes to know whether there is any uniformity in other sections and what the size of the ordinary cutters' box should be. Mr. George H. Waters, proprietor of the Pomona Cannery answers as follows:

We are using a uniform box smaller than we had years ago, of the following dimensions 2 feet long, 14 inches wide, 7 inches deep, which makes a 40 pound box. We are paying 8 cents a box for cutting, regardless of size of fruit, only we do not receive any little fruit that will not run 1¼ inches. The 40 pound boxes give much better satisfaction all around, and keep the fruit in much better condition.

### Franquette Walnuts.

Would Franquette walnuts fill well in the locality of Ripon, San Joaquin County? The soil is sandy loam twenty feet deep, though on the river-bottom soil is rich and heavy and about six feet to hardpan.—J. A. P., Ripon.

Franquette walnuts fill well in the Sacramento Valley at Marysville. This would warrant us in saying that they would fill well at Ripon. There is one condition, however. The Franquette walnuts should be either on the hybrid or California black walnut root. They will fail either on their own or English walnut root.—J. W. M.

### Leaves Too Light.

What element in the soil is most likely to be lacking when the leaves of trees and other plants not indigenous to the country have a tendency to be a very light green or even white? The soil is sedimentary and the natural growth mostly mesquite.—C., Mercedes, Texas.

We do not know that we ever heard of a case exactly like this, and will ask our subscribers to give us their experience. What is the trouble with this soil, or is it a matter of climate?

### Stock For Peaches In Moist Soil.

What kind of root will stand the dampest soil when peach and almond root drown out?—M. E. M., Ritchey, Amador County.

The myrobalan plum is the proper root in moist conditions and will stand far more moisture than either peach or almond. Many nurserymen are now using it almost entirely as stock for budding or grafting peaches and plums.

### Splitting Pits.

Many peaches in the Napa Valley are splitting badly at the pits. They also turn yellow and fall off before they are ripe. The trees appear to be in perfect health. None seem to be immune except Hale's Early, Early Alexander and Early Foster. What is the cause and remedy?—Subscriber.

We would recommend that these peach trees be sprayed with either lime, salt and sulphur wash or Bordeaux mixture late in the winter or early spring. There is nothing to be done for them now. Climatic conditions may affect the proper development of the fruit, but fungous diseases are responsible for most of the trouble.—J. W. M.

### Tomato Blight.

What is the matter with my tomato vines? They look as if they were mildewed. There is bloom on the vines, and they are having a struggling growth. Is there anything I can put on them to remove this?—W., Monrovia.

This is most likely blight and a plant once so far gone as to plainly be noticed with the naked eye might as well be dug up and burned. Spraying with Bordeaux is the only remedy but it should be used as a preventive. I have never been able to restore a plant that had a well developed case.—Q. A. L.

### Gum Leaves for Mold.

Can I use blue gum leaves in preparing leaf mold for potting plants? Can I use water which is slightly alkaline in making Bordeaux mixture? A. R. S., Santa Barbara.

We can see no objection whatever to the use of eucalyptus leaves and imagine they would make a good leaf mold. We have noticed they do not decay very quickly perhaps because of being filled with oil, but in time they work down to a fine mold.

No possible injury could result from the use of alkali water in making the mixture.

### Answers To Bee Questions.

In answer to G. Weidman Graff, Canton, China; Ecole d'Apiculture De Band, France; James C. Forbes, Westchester ,N. Y.; C. and many others: The "F. W. Bee Keeper" is no longer published separately. Its subscribers are being served with the present journal.

### Foul Brood Law.

J. W. Antioch, W. A. T. Bishop: No, the amendment to the Foul brood law did not pass at the last session of the legislature. Nor, is there much prospect of its passage in its

No Real Estate. No Furniture and Fixtures. No Premium on U. S. Bonds.

STATE OF CALIFORNIA, County of Los Angeles. ss.

I, W. T. S. Hammond, Cashier of the above named bank, do solemnly swear that the above statement is true to the best of my knowledge and belief.

W. T. S. HAMMOND, Cashier.

Subscribed and sworn to before me this 24th day of June, 1909.

HORACE B. KING, Notary Public.

Correct—Attest:

J. M. ELLIOTT, G. E. BITTINGER, WALTER J. TRASK,
STODDARD JESS, J. C. DRAKE, JNO. B. MILLER,
W. C. PATTERSON, M. H. FLINT, H. JEVNE,
} Directors.

present shape at the next. The merits or demerits of said bill will be discussed in the Cultivator later on. Henry E. Horn.

### Hay For A Cow For 30 Days.

How much hay will a cow eat in one month if kept in a corral where there is no other feed?—J. S. H., Kingsburg.

One thousand pounds per cow is the usual allowance. If the hay is extra good alfalfa, eaten clean, less will do. In buying hay for dairy use, we count two cows to a ton for every thirty days. This allows for any that may be over cured and have strawy stems.—M. E. S.

### Yellow Jackets.

Please tell me how to keep yellow jackets from the grapes when drying raisins?—J. S., Morgan Hill.

We do not have yellow jackets in the Great Valley. If the pest was too much to be endured and nests could not be readily destroyed, I should send the grapes to the cannery. An organized farmers' club offering the boys so much to destroy yellow jacket nests might be organized if the neighborhood is sufficiently settled.—M. E. S.

### Trouble With Cud.

I have a Jersey cow which seems to have too large a cud. It seems to be in two parts, gets wedged in between teeth and cheek on both sides of her mouth, and she can't eat till I remove it. Why does this occur, and what can I do to remedy the trouble?—A. A. F., Gardena.

Examine the cow's mouth for sharp and irregular teeth or foxtail. If there is no trouble there, then give her a dose of epsom salts (one pound for a dose), adding some ginger and a tablespoon of baking soda. Then see that she has enough long straw or roughage of some sort to make a good matted cud. Cows that are fed on lawn clippings without any long stuff mixed in are often affected this way.—M. E. S.

### Holstein Association.

Why do you think the Holstein Association better than the other associations. Are their papers more correct?—J. S., Kerman.

I have not said that the Holstein Association is better, but as I have had dealings with horse associations, swine breeders and the rest, I certainly appreciate its wonderful system and the prompt attention that the secretary of the Holstein Friesian Association gives to requests, and the short time it takes to register or transfer an animal. I have waited from seven to ten months for horse papers and for pig papers nearly as long. When an animal is sold the purchaser naturally blames the seller if there is any delay in sending the papers. Blame is never agreeable even when we are at fault, but when we are waiting and writing for papers and cannot get them, we feel like giving thanks that we can secure the cattle papers within a short time.—M. E. S.

---

The hop crop in Oregon is reported a serious failure this year. According to the Salem Statesman the Gervais section will produce only about a 40 per cent crop and all estimates agree that the total output for the state will not exceed 50,000 bales. Many place it as low as 40,000 bales. Owners are now looking for a fifteen to twenty cent market.

---

The Colorado has passed its high water mark and is now receding.

# Legal Queries

**Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.**

**Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.**

### Personal Property—Real Estate.

About forty days ago I sold my orange grove, retaining possession for sixty days. Nothing was said about the fertilizer in the corral. Does it belong to me, together with what has been made since?—W., Ontario.

There is some difference of opinion arising by reason of conflicting decisions in some of our states, as to whether manure made on the farm is part of the real estate, or is personal property, a number of the states holding that it is part of the soil, where it is made in the ordinary course of husbandry and consists of collections from stable and barn yards, or of composts formed by an admixture of these with soil or other substances; but the opinion, most in keeping with our statutory law on the subject of fixtures, holds that when it is lying around in heaps it does not pass as real estate, but if mixed with, or scattered upon the soil with the intention of rendering the soil more productive or otherwise utilizing it in connection with the soil, for the benefit of the estate, it is real property. So far as I know, the question has not been settled in this state by decision of the Supreme Court.—E. L. P.

### Water Right.

There is a stream running through my land that after the first of July is fed entirely by a spring on a neighbor's land, running about two inches. I have just filed an appropriation for five inches of water for irrigation purposes. My neighbor has not made use of the water for at least ten years. He now threatens to put in gas engine and pump. Has he a right to do this? I have filed my appropriation according to law.—Subscriber.

Water rights can not be acquired by appropriation where the water is on private property. If the appropriation had been made and completed bebefore the land, on which the spring is situated, passed into private ownership, the appropriator would have the prior right to the water from the spring.

The foregoing answers the injuiry, but it may be of interest to readers of the Cultivator to know that where a spring is fed solely by percolating waters which seep into it from swamp or wet lands surrounding the same, and not by any running stream of water, there is no water at such spring to which the right of use can be acquired, either by statutory appropriation or by adverse user, and no action will lie in favor of one who has collected the water at the spring in a reservoir and transmitted it by a pipe for use, against one who has diverted the water from the reservoir by means of an excavation on his own land for irrigation and domestic purposes. This is for the reason that percolating water is considered as a part of the soil, and is as much the property of one who acquires the land, as is the soil itself.

To make any appropriation of water valid, the appropriation must have been made while the land, at the point where the appropriation was made, was public land.

---

Leroy Anderson has been re-appointed superintendent of the University Farm School at Davis.

# Classified Liners

## MACHINERY.

THE R. KELLY MACHINERY CO., Mission Road and Macy Street, Los Angeles, Cal., carry a large stock of secondhand machinery, boilers, steam and distillate engines, steam and power pumps and jacks, air compressers, water and oil tanks, pulleys, belting, hangers, etc. 25 car loads pipe and fittings, all sizes. Lot of iron fence posts, fine for wire fence.

FOR SALE—SECOND HAND WINDmills, tanks, pumps, engines, hay rake, cultivator, mower, wood sawing outfit, spraying outfit, light wagons, anything a rancher wants secondhand. DEMMITT CO., 120 N. Main St., upstairs, Los Angeles, Cal.

FOR SALE—RENT OR EXCHANGE, boilers and engines, gas engines, pipe and oil well casing, pumps, all sizes and makes; get our prices before you buy. A. CANNADY & CO., 691 N. Main St., Los Angeles, Cal.

FOR SALE—ALAMO GASOLINE ENgines, large stock just received from the works. See the engines and get our prices. Prices right. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles, Cal.

EXCHANGE—ELECTRIC MOTOR TO trade for gas engine. MACHINERY EXCHANGE, 117 Bruno St., Los Angeles, Cal.

FOR SALE—DE LAVAL SEPARATOR, in perfect condition, capacity 400 lbs. per hour. W. J. WALLACE, R. D. 1, Riverside, Cal.

FOR SALE—ONE TEN AND ONE twelve H. P. Union gasoline engines, both snaps. Corner Main & Bruno Sts., Los Angeles, Cal.

FOR SALE—CENTRIFUGAL PUMP and gas engine. Good as new. H. H. SIMPERS, 945 N. Main St., Los Angeles Cal.

## TREES.

FOR SALE—ABOUT 250 VALENCIA orange trees. Will sell in ground at right prices. Come and see them. M. E. DILLINGHAM, San Gabriel, one mile north of Masonic Home. Phone Black 198, Alhambra Home.

FOR SALE—1500 EUREKA LEMONS, 1 and 2 years old; Blue gums, Sugar gums, and Red gums; street and ornamental trees, etc. GEO. B. WARNER, Santa Ana, Cal.

FOR SALE—EUCALYPTUS PLANTS, small orders or car lots, also take contracts growing any quantity. A. BLASINGAME, 15-23 Nineteenth St., Santa Monica, Cal.

## FERTILIZERS.

NOW IS THE TIME
to fertilize for results in the coming crop.
ARMOUR'S "O.T.M.", "B.B.&P.", and "5-8-2" grow big crops and build up the soil. They have been doing it for years.
THE ARMOUR FERTILIZER WORKS, Los Angeles, Cal.

## HOGS.

REGISTERED BERKSHIRE AND POland China hogs, both sexes. C. A. STOWE, Stockton, Cal.

## SHOPPING BY MAIL.

PURCHASE THROUGH US ANYTHING desired. Ask about our new system of teaching telegraphy by mail, full set instruments free. COLUMBIA COMMERCIAL COMPANY, 204 East 9th St., Los Angeles, Cal.

The shaping of a tree should be done when it is young. The practice of allowing useless limbs to grow only to be sawed or chopped off when the tree is large is a mistake, as every undesirable limb grown deprives the other limbs of so much food and nourishment. Begin with the first year and train the tree to the shape desired, leaving only such branches as will be retained later on.

### BIG APPLE CROP IN SIGHT.

From all indications the apple crop this year will be a bumper, and farmers already are planning to take care of the yield. On account of the great demand for cider, many fruit men will soon begin getting busy buying new machinery for that purpose. The name of The Hydraulic Press Mfg. Company of Mt. Gilead, Ohio, has been associated with cider-making machinery for so long, and their presses are giving such universal satisfaction, that we do not hesitate to recommend them to our readers who are thinking of buying machinery for cider making.

They also make Apple Butter Cookers, Vinegar Generators, and everything for the cider and vinegar man.

Write them for their new catalog, which contains some valuable information. Mention this paper, and address The Hydraulic Press Mfg. Company, 123 Lincoln Ave., Mt. Gilead, Ohio.

## FARM LANDS FOR SALE.

YOU CAN MAKE MONEY ON THIS fine dairy and beet ranch. I own one of the finest dairy and beet ranches in the San Joaquin Valley, located on the Santa Fe Railway, between Corcoran and Tulare. It has two water rights with plenty of water, is fenced and cross-fenced, and has good house, large cattle barn and out buildings. Two hundred acres are in alfalfa, part of which was recently seeded. Balance in grain. Eighty to one hundred cows are kept at present, and about $5000 is realized annually from the dairy products alone. With careful management the place will pay $10,000 yearly. Two beet sugar factories are within easy reach. Owner is no rancher and wants to sell or lease to responsible party with some capital. Price $36,000. Address owner, ULRICH KNOCH, 350 S. Los Angeles St., Los Angeles, Cal.

FOR SALE—SEVEN HUNDRED AND three (703) acres of choice grain land, six miles from Oakdale, Stanislaus County, California, on the Sierra Railroad, connecting with the Santa Fe at Oakdale, and three miles from Orange Blossom Colony. Land all fenced; dwelling house; barn, windmill, cement water tank with capacity of 20,000 gallons. Price per acre, $25; half cash, balance on mortgage. If not sold by August 1st, 1909, will be open for rent for 3 years. Address A. S. EMERY, Oakdale, Cal.

FRESNO COUNTY ORANGE RANCH of 20 acres for sale.—13 acres of bearing trees, 7 acres of young Valencias. This is the only orange orchard in this district for sale that we know of. Write us for particulars. THE CITRUS LAND COMPANY, Sanger, Fresno Co., Cal.

FOR SALE—PALOMITAS VINEYARD 194 acres; 106 planted to choice Emperor, Malaga and Muscat vines, 3 to 5 years old. Part or all. Half cash, balance on easy terms. MRS. M. E. SHERMAN, Fresno, Cal.

FOR SALE OF EXCHANGE FOR LOS Angeles or Orange County walnut land, 140 acre mountain apple, berry, vegetable and chicken ranch, near Santa Cruz. WILLIAM RICHARD, owner, 438 River St., Santa Cruz, Cal.

BUY A LINDSAY ORANGE GROVE—20 acres just coming into bearing; ¾ mile east of high school, ¾ mile from mountains; plenty water, piped; good land; good buildings; choice neighborhood. For sale by owner at bargain. Box 143, Lindsay, Cal.

GRAIN AND STOCK FARM, 316 acres 3 miles from Oakdale, fenced in 4 fields, hog-tight, with stock and implements; by owner. Price $10,000. Box 121, Oakdale, Stanislaus County, Cal.

I MAKE A SPECIALTY OF ORANGE and alfalfa ranches and exchanges. 826 Main St., Room 9, Riverside, Cal. N. R. BELL.

## POULTRY.

BUFF PLYMOUTH ROCKS, BRED TO lay, win and pay. My birds have won more prizes than all competitors combined. Eggs and stock. Circular, DR. W. H. HOLMES, Slavin Block, Pasadena, Cal.

THOROUGHBRED MALTESE HEN pigeons, $1.50 pair. JOHN HERING, Mill Valley, Cal.

HOUDAN COCKS AND TRIOS FOR sale cheap to make room. MRS. R. HEGI, Box 272, Dixon, Cal.

PURE PIT GAMES—YOUNG TRIOS, quail size, $3.50. O. L. CRANE, Route 3, Santa Rosa, Cal.

## EGGS FOR HATCHING.

### OPPORTUNITY.

They do me wrong who say I come no more
When once I knock and fail to find you in;
For every day I stand outside your door,
And bid you wake and rise to fight and win.
Wail not for precious chances passed away,
Weep not for golden ages on the wane;
Each night I burn the records of the day,
At sunrise every soul is born again.
Laugh like a boy at splendors that have sped,
To vanished joys be blind and deaf and dumb;
My judgments seal the dead past with its dead,
But never bind a moment yet to come.
Though deep in mire, wring not your hands and weep,
I lend my arm to all who say: "I can."
No shamefaced outcast ever sank so deep
But he might rise and be again a man.

—Walter Malone.

### A VISIT TO THE OLD HOME.

"HELLO, Jim! where have you been lately?" shouted a broker the other evening to a portly, finely dressed man in the corridor of the Palmer House. The gentleman stopped, shook hands with his friend, and replied: "I've been home to see my old father and mother, for the first time in sixteen years, and I tell you, old man, I wouldn't have missed one day of all that visit for all my fortune."

"Kind of good to visit your boyhood home, eh?"

"You bet. Sit down. I was just thinking about the old folks and feel talkative. If you have a few minutes to spare, sit down, light a cigar and listen to the story of a man who in the chase for wealth had almost forgotten his father and mother."

They sat down and the man told his story.

"How I came to visit my home happened in a curious way. Six weeks ago I went away duck shooting. I had a lunch put up for me, and you can imagine my astonishment when I opened the hamper to find a package of crackers wrapped up in a piece of the little patent-inside, country weekly published at my home in Wisconsin. I read every world of it, advertisements and all. There was George Billing, who was a schoolmate of mine, advertising ham and salt pork, and another boy was postmaster. By George! It made me homesick, and I determined then and there to go home, and go home I did.

"In the first place I must tell you how I came to Chicago. I had a tiff with my father and left home. I finally turned up in Chicago with a dollar in my pocket. I got a job running a freight elevator in the very house in which I am now a partner. My haste to get rich drove the thoughts of my parents from me, and when I thought of them, the hard words that my father last spoke to me rankled in my bosom. Well I went home. I tell you, John, my train seemed to creep, I was actually worse than a schoolboy getting home for vacation. At last we neared the town. Familiar sights met my eyes, and upon my word they filled with tears. There was Bill Scott's red barn, just the same; but—great Scott! what were all the other houses? We rode nearly a mile before coming to the station, passing many houses, of which only an occasional one was familiar. The town had grown to ten times its size when I knew it. The train stopped and I jumped off. Not a face in sight that I knew, and I started down the platform to go home. In the office door stood the station agent. I walked up and said: 'Howdy, Mr. Collins?' He stared at me and replied 'You've got the best of me, sir.'

"I told him who I was and what I had been doing in Chicago, and he didn't make any bones in talking to me. Said he: 'It's about time you came home. You in Chicago rich, and your father scratching gravel to make a bare living!'

"I tell you, John, it knocked me all in a heap. I thought my father had enough to live upon comfortably. Then a notion struck me. Before going home I telegraphed to Chicago to send me $1000 by first mail. Then I went into Mr. Collin's back office, got my trunk in there and put on an old hand-me-down suit that I use for fishing and hunting. My plug hat I replaced by a soft white one, took my valise in my hand and went home. Somehow the place didn't look right. The currant bushes had been dug up from the front yard, and the fence was gone. The house looked smaller, somehow, too. But I went up to the door and rang the bell. Mother came to the door and said: 'We don't wish to buy anything today, sir.'

"It didn't take me a minute to survey her from head to foot. Neatly dressed, John, but a patch and a darn here and there, her hair streaked with gray, her face thin, drawn and wrinkled. Yet over her spectacles shone those good, honest, benevolent eyes. I stood staring at her, and then she began to stare at me. I saw the blood rush to her face, and with a great sob she threw herself upon me and nervously clasped me about the neck, hysterically crying: 'It's Jimmy, it's Jimmy!'

"Then I cried too, John. I just broke down and cried like a baby. She got me into the house, hugging and kissing me, and then she went to the back door and shouted, 'George!'

"Father called from the depths of the kitchen, 'What do you want, Carline?'

"Then he came in. He knew me in a moment. He stuck out his hand and grasped mine, and said sternly: 'Well, young man, do you propose to behave yourself now?' He tried to put on a brave front, but he broke down. There we three sat like whipped school children, all whimpering. At last supper-time came, and mother went out to prepare it. I went into the kitchen with her.

"'Where do you live?' she asked.

"'In Chicago,' I replied.

"'What are you working at now, Jimmy?'

"'I'm working in a dry-goods store

"Then I suppose you don't live very high, for I hear of city clerks who don't get enough money to keep body and soul together. So I tell you, Jimmy, we've nothing but roast spareribs for supper. We're poorer nor Job's turkey.

"I told her I would be delighted with the spareribs, and to tell the truth, John, I haven't eaten a meal in Chicago that tasted as good as

those crisp roasted spare-ribs did. I spent the evening playing checkers with father, while mother sat by telling me all about their misfortunes, from old white Molly getting drowned in the pond to father's signing a note for a friend and having to mortgage the place to pay it. The mortgage was due inside of a week, and not a cent to meet it with—just $800. She supposed they would be turned out of house and home, but in my mind I supposed they wouldn't. At last nine o'clock came and father said: 'Jim, go out to the barn and see if Kit is all right. Bring in an armful of old shingles that are just inside the door and fill up the water-pail. Then we'll go off to bed and get up early and go fishing.'

"I didn't say a word, but I went out to the barn, bedded down the horse, broke up an armful of shingles, pumped up a pail of water, filled the woodbox and then we all went to bed. Father called me at 4:30 in the morning and while he was getting a cup of coffee I skipped over to the depot, cross lots, and got my bass rod. Father took nothing but a trolling line and a spoon hook. He rowed the boat with the trolling line in his mouth, while I stood in the stern with a silver shiner rigged on. Now, John, I never saw a man catch fish as he did. To make a long story short, he caught four bass and five pickerel, and I never got a bite.

"At noon we went ashore and father went home, while I went to the postoffice. I got a letter from Chicago with a check for $1000 in it. With some trouble I got it cashed, getting paid in $5 and $10 bills, making quite a roll. I then got a roast joint of beef, and a lot of delicacies, and had them sent home. After that I went visiting among my old schoolmates for two hours, and went home. The joint was in the oven. Mother had put on her only silk dress and father had donned his Sunday-go-to-meeting-clothes, none too good, either. This is where I played a joke on the old folks. Mother sat in the kitchen watching the roast. Father was out in the barn, and I had a clear coast. I dumped the sugar out of the old blue bowl, put the thousand dollars in it, and placed the cover on again. At last supper was ready. Father asked a blessing over it, and he actually trembled when he stuck his knife in the roast.

"'We haven't had a piece of meat like this in five years, Jim,' he said, and mother put in with, 'And we haven't had any coffee in a year, excepting the times when we went a-visiting!' Then she poured out the coffee and lifted the cover of the sugar-bowl, asking as she did so, 'How many spoonfuls, Jimmy?'

"Then she struck something that wasn't sugar. She picked up the bowl and peered into it, 'Aha, Master Jimmy, playin' your old tricks on your mammy, he? Well, boys will be boys.'

Then she gasped for breath. She saw it was money. She looked at me, then at father, and then with trembling fingers drew the great roll of bills out.

"Ha! ha! ha! I can see father now as he stood there, then, on tiptoe, with his knife in one hand, fork in the other and his eyes fairly bulging out of his head. But it was too much for mother. She raised her eyes to heaven and said slowly, 'Put your trust in the Lord, for he will provide.'

"Then she fainted away. Well, John, there's not much more to tell. We threw water in her face and brought her to and then we demolished that dinner, mother all the time saying 'My boy Jimmy! my boy Jimmy!'

"I stayed home a month. I fixed up the place, paid off all the debts, had a good time, and came back again to Chicago. I am going to send $50 home every week. I tell you, John, it's mighty nice to have a home."

John was looking steadily at the head of his cane. When he spoke he took Jim by the hand and said: "Jim, old friend, what you have told has affected me greatly. I haven't heard from my home way out in Texas for ten years. 'I'm going home tomorrow."—Exchange.

# About the House

A COOK BOOK—not a printed one—but one written in pencil on the blank leaves of an old account book—fell into my hands the other day and I have copied several of the recipes—they are tested ones—that I thought some of the Cultivator readers might like to try.

**White Cake.**

Two cups of sugar and one-half cup of butter creamed together. Sift two level teaspoons of baking powder with two cups of flour and add to the creamed butter and sugar. Mix until like corn meal. Moisten with one cup of water, then add the whites of four eggs, well beaten. Sometimes it is necessary to add more flour—a half cup or more.

**Sponge Cake.**

One and one-half cups of sugar, two-thirds of a cup of water, four eggs well beaten, two level teaspoons of baking powder, and enough flour to make the batter of the proper consistency. Bake in a rather quick oven.

**Cream Pie.**

One pint of cream, one and one-half cups of powdered sugar, and the whites of three eggs. Pour the cream over the sugar and let stand until the whites of the eggs have been beaten to a stiff froth. Add the beaten eggs to the cream and sugar and beat well. Flavor with nutmeg or vanilla.

**Pine Apple Tapioca Pudding.**

Soak one cup of tapioca in plenty of water for twelve hours. Drain and put the tapioca in a kettle with one-half can of sliced pineapple, cut in dice, the juice of two lemons, one-half cup of water, one and one-half cups of sugar. Cook slowly until almost clear, stirring gently every few minutes. Then whip the whites of three eggs to a stiff froth, and stir in. Pour into a mould at once and let stand until cold. Serve with whipped cream.

**Muffins.**

Two cups of flour and two level tablespoons of baking powder, one level teaspoon of salt, two rounding tablespoons of sugar, one egg, one cup of milk and one tablespoon of melted butter. Sift the flour, baking powder, salt and sugar together; beat the egg until light and add to the milk. Mix with the dry materials. Then add the melted butter. Stir just long enough to make a smooth batter. Bake in gem pans or muffin rings in a quick oven.

**Escalloped Salmon.**

Drain the liquor off a can of salmon, then add to the salmon one cup of rolled crackers, one cup of sweet milk, and season with salt, pepper and butter. Place in a buttered pan and bake for about fifteen or twenty minutes.

**Beef Loaf.**

Three and a half pounds of beef, six soda crackers, three eggs, two-thirds of a cup of milk, one scant tablespoon of salt, one-half teaspoon of pepper, one tablespoon of butter. Chop or grind the beef, add the crackers, rolled fine, then the milk, salt, pepper and melted butter. Mix thoroughly with the hands, add the eggs, and mix again. Make into a loaf like bread, and bake in a moderate oven one hour and a half.

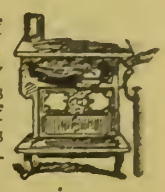
**Cheese Straws.**

Three tablespoons of grated cheese, three tablespoons of flour, a little salt and cayenne pepper, one tablespoon of melted butter, one tablespoon of water and the yolk of one egg. Mix into a dough, roll thin as for cookies and cut into strips five inches long and one-fourth or one-half inch wide. Then bake about ten or fifteen minutes.

**Fudge.**

Two cups of sugar, one cup of milk, one-fourth cake of unsweetened chocolate. Cook, stirring it until it will form a soft ball when dropped in cold water. Remove from the fire and stir until it is almost cold. Then pour in buttered pans and cut in squares.—Elbepe.

**Hague Domestic Oil Burner**



Showing the Method of Attaching to Cook Stove. A device for using low grade distillate. Saves 40 per cent of cost of coal or city gas—let us prove it. Write for circular.

**Hague Domestic Oil Burner Co.**

### Hay.

Scott & Magner say: Arrivals of hay during the past week have been 4000 tons. We note a steady increase from week to week in arrivals here, and this week's receipts were the largest we have had since last summer.

The new demurrage law which went into operation last Monday, and which penalizes the receivers of hay here at the rate of $6.00 per car after 48 hours, has also had its effect. Hay must be moved immediately, or be subjected to a tax of $6.00 per day per carload. Therefore the practice of letting hay remain on the cars for several days until satisfactory sale can be made of it, must be discontinued. Arrangements therefore are necessary to move off each carload in, proper time, which occasions the forcing of a good deal of hay that, under the old conditions, was avoided.

There has been a little alfalfa hay arriving, but not enough to establish any active market.

We quote the general range of prices on today's market as follows:
Choice wheat hay .....18.00@20.00
No 1 wheat or wheat & oat 16.00@17.00
No 2 wheat or wheat & oat 14.00@15.50
Choice tame oat .....16.50@17.50

## Deciduous Market

SACRAMENTO, CAL., June 26, 1909.

During the fore part of last week the deciduous market declined somewhat on peaches and Cots but yesterdays' sales show peaches as stronger with no change in the Cot situaton. The range of prices is as follows: Triumphs, 95c to $1.40; Cots, $1.15 to $1.55. The supply of Alexanders is finished and Triumphs are practically through, the principal variety going forward at the present time being Hales. St. Johns will come in next week. The supply of Cots in the Vacaville and Winters districts is practically exhausted, as far as shipping is concerned.

The market on plums has been very steady, with a good demand. Abundance averaged $1.35; Burbanks, $1.20 to $1.45; Clymans, 95c to $1.25; Climax, $1.40 to $1.75. Shipments of plums this week have been rather heavy, quite a quantity of Tragedies being shipped.

A few lots of Bartlett pears are moving from the Sacramento River district but so far the supply has been very light.

The cash prices to growers established by speculators are as follows: Hales, 40c; St. Johns, 50c; Imperials, 50c; Botans, 60c; Simoni, 85c; Triumphs, 55c; Ogons, 60c; Abundance, 60c; Red Junes, 70c; Climax, 75c; Tragedy, 85c; Burbanks, 75c.

The price established in the Sacramento River district for Bartlett pears is 70c per box, unpacked, bank delivery. Comparative shipments up to, and including June 25th, 1909, 737 cars; same date, 1908, 839 cars; same date, 1907, 572 cars.—T. C. Tucker.

## Citrus Market

LOS ANGELES, June 30, 1909.

While Valencias are holding their own, or even better, in all markets even to the auctions, seedlings, Mikes, sweets and other than Valencias are going begging. For some reason buyers seem to have cut off seedlings without any consideration whatever. Even the few navels yet to be disposed of seem to be commanding slight attention in the auctions.

The big money at this time is being received by the lemon men. The auctions are paying $6 to $8, and $7 f.o.b. Eastern points in common. This is brought about by the combination of excessively hot weather all over the East and the shortage in foreigns. California is forwarding very liberally which means a good return to practically all lemon people.

**Shipments.**

Shipments of all citrus fruit still hold up well to the hundred car per day mark. Total for the season of all citrus fruits since November 1st: 31,356 cars; of which there were 27,137

oranges, and 4219 lemons. At the same date last season, 25,707 cars; of which 22,342 were oranges and 3355 lemons.

NEW YORK, June 28.—Forty-four cars oranges, one grapefruit, and one car lemons sold. Market very steady, considering size of offering. Hot and muggy, threatening rain. Sale extended far into the afternoon.

## SOME ALFALFA DON'TS.

Don't fail to provide for ample inoculation; soil from an old alfalfa field is best.

Don't sow poor or weedy seed.

Don't sow on a weedy soil.

Don't sow on any but a sweet, well-limed soil.

Don't sow on poorly drained soil.

Don't sow on any but a finely prepared, well-settled seed bed.

Don't pasture the first or second year.

Don't lose the leaves; they constitute the best part of the hay.

Don't seed a large acreage to begin with. Experiment on a small area first.

Don't give up. Many prominent alfalfa growers finally succeeded only after many failures.

County Entomologist Volck of Santa Cruz county, reports that it is abundantly proved that no injury comes from the use of arsenate of lead for spraying for the codling moth. He recommends the use of a pound and a half or two pounds to fifty gallons of water.

## DIVIDEND NOTICES OF THE ASSOCIATED SAVINGS BANKS OF SAN FRANCISCO.

THE GERMAN SAVINGS AND LOAN SOCIETY 526 California St., Mission Branch, 2572 Mission St., near 22nd. Richmond District Branch, 432 Clement St., between 5th and 6th Avenues, San Francisco. For the half year ending June 30, 1909, a dividend has been declared at the rate of four (4) per cent per annum on all deposits, free of taxes, payable on and after Thursday, July 1, 1909. Dividends not called for are added to the deposit account and earn dividends from July 1, 1909.

GEORGE TOURNY, Secretary.

* * *

SAN FRANCISCO SAVINGS UNION, northwest corner California and Montgomery Sts. For the half year ending June 30, 1909, dividends have been declared at the rates per annum of four and one-eighth (4⅛) per cent on term deposits, and four (4) per cent on ordinary deposits, free of taxes, payable on and after Thursday, July 1, 1909. A dividend not drawn will be added to the deposit account, becomes a part thereof and earns dividend from July 1st. Money deposited on or before the 10th day of July will receive dividend from July 1st.

R. M. WELCH, Cashier.

* * *

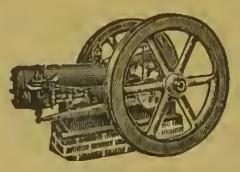
THE SAVINGS AND LOAN SOCIETY, 101 Montgomery St., corner Sutter St., San Francisco. For the half year ending June 30, 1909, a dividend has been declared at the rate of four (4) per cent per annum on all deposits, free of taxes, payable on and after Thursday, July 1, 1909. Dividends not drawn become part of deposit accounts, and earn dividends at the same rate, from July 1. Money deposited on or before July 10 will earn interest from July 1.

WM. A. BOSTON, Cashier.

## RESOURCES OF CALIFORNIA.

The California State Board of Trade is mailing its review of the resources and possibilities of the state, or, more properly, its Nineteenth Annual Report. On the front cover is a relief map of California in three colors, which, though small, gives a valuable idea of the location of the tillable lands and the mountainous regions of the state. The pamphlet is filled with reliable statistics, together with special articles by authorities on agriculture and our various products.

The Board is organized for the purpose of attracting the attention of eastern people to the wealth producing possibilities and desirable home making features of our state.



## Information That Is Worth
# DOLLARS
## To You

Isn't it worth money to know that with our patented vaporizer (found only on the Western) you will get from 25 to 30 per cent more power out of a gallon of low grade distillate than other engines get from a gallon of high grade gasoline? Five minutes' work with a scratch pad will show you what effect this will have on your fuel bills.

Ask us about the Nix-Frost Crude Oil Gas Producer, the cheapest power on earth using Crude Petroleum as fuel.

## Cotton King Disk Harrow

This harrow is symmetrical in design and strong enough to withstand the heavy work which a disk harrow encounters in a field. It is equipped with three steel standards, which insures great strength and will not clog when working over freshly-plowed ground or among clods. It will work equally well in any condition of soil, no matter whether the field is sandy or soggy. The gangs respond promptly to the levers so that the driver can easily adjust the disks to work at any desired angle. The frame is high and the disks can be so extended that there will be ample room for passing the plants when using the harrow as a cultivator. The levers do not extend below the tongue where they would interfere with the plants being cultivated. This disk harrow is just what you need. Come and investigate.

Send for Complete Harrow Catalogue

112-18 So. Los Angeles Street **ARNOTT & CO.** Los Angeles Cal.

## California Genuine Sardines

### Not a Substitute, but a Genuine Sardine

They have all the old time Sardine qualities. Delicious in flavor, a wholesome, nutritious food. You will prefer them to any you have ever eaten.

**PROFESSOR DAVID STARR JORDAN,** President of Leland Stanford University The leading authority on fishes of the Pacific Coast, writes of the California Sardines, in "Fishery Industries of the United States," 1894, page 569: "This species is everywhere known as the Sardine or by the Italians as Sardinea." It is in fact almost identical with the sardine of Europe.

**Your Only Protection**

against substitution lies in becoming acquainted with our brands.

**Don't Ask for a Can of Sardines or California Sardines**

But ask for any of the following brands and insist upon getting them:

# Practical Methods in Alfalfa Growing

## Letters from Growers Who Know With Many Suggestions of Value

SO MUCH exceptionally good material came in for the alfalfa articles last week that we have held over a large supply of it for leader this week. It will be remembered that in the last issue we gave the list of questions sent out to the various growers, which are answered practically in full by the following contributors. Taken all together these answers prove that every grower must consider his own conditions and surroundings, just as he must do if he successfully grows any other crop. For instance the time of cutting alfalfa depends upon the use to which it is to be put. If it is to be used for the dairy stock, as is usually the case, it should be cut the moment the blossoms begin to appear; if for horses, several days later gives better hay. It is also shown that greater tonnage is secured by the earlier cutting.

Plainly the principal alfalfa in this country is the common or Chilean variety. The tests made of Arabian alfalfa indicate that its popularity will probably become much greater than at present. On the subject of irrigation there is the greatest diversity of opinion. Also various opinions are expressed as to the practice of planting alfalfa between orchard trees; some holding that it is even beneficial, while others would not allow it under any circumstances. We believe that if it is planted in this way, the greatest care should be exercised and abundant water supplied, or the trees may be seriously handicapped. Following are the remainder of the articles which we have received:

**N. C. BLanchard, Hanford, Kings County.**

1. Have never tried any variety except the common one universally grown in this locality.

2. (a) Irrigated first three years out of seven; afterwards discovered that I had better results without surface irrigation as land is subirrigated. (b) Never built any checks. Land in Kings River Delta is irrigated best by contour ditches. Checking is neither necessary nor desirable.

(c) Do not try to have water stand on land at all—simply cut contour ditches on highest levels and let water soak to lower points. When high points are sufficiently wet, water is cut off and surplus waters lower lands sufficiently.

3. (a) Land plowed deeply, the deeper the better (should not be less than ten inches) and harrowed thoroughly as often as necessary to put in good tilth. (b) No.

4. (a) I prefer to seed as near to March 1st as possible, and sow from 15 to 20 pounds seed per acre. (b) Sow broadcast. (c) Did not screen—try to buy clean seed. (d) Yes. Notwithstanding all expert recommendations to the contrary. Alfalfa on Kings River Delta land does better with nurse crop of 40 to 50 pounds wheat or barley. The principal reason for this is that the nurse crop keeps weeds down. Without it very little return can be had from the first and second cuttings which will be mostly sunflowers. With a nurse crop a first cutting of grain hay may be taken off and two crops of alfalfa during first season.

5. (a) After third year would disk once a year, preferably during winter, choosing a time when surface is not too wet but soft enough to stir. Prefer the toothed disc known here as "Alfalfa Regenerator." (b) Never used any fertilizer.

6. Scarcely any foxtail during first four years, later it began to come in. I cut it with crop and sold at lower price.

7. Four to five cuttings per year.

8. (a) Sold hay. (b) Never pastured stock on it at all.

9. The only pests here are ground squirrels and pocket gophers. These can be kept in subjection by poisoning and drowning out by a special irrigation.

10. Kept land in alfalfa eight years. If cultivated and not pastured it should be good for fifteen or twenty years.

11. I have never grown alfalfa between fruit trees.

12. (a) I like best to cut when blooms are just starting, say about three or four to each square yard. (b) Mow in the later afternoon or early morning and rake in afternoon, allowing it to lie over night in swath then bunching next day by hand and allow it to cure in the bunch pretty thoroughly before stacking.

**J. N. Lester, Denair, Cal.**

1. I have chiefly grown the common English variety. This year I have seeded some Turkestan and Sand Lucerne (Medicago Media.)

2. I irrigate, making checks eight feet wide at base and twelve inches high. From the high check I aim to level ground to a three-tenths foot grade, and prefer to let the water stand only deep enough to cover the highest part in the check.

3. After leveling, I plow (preferably deep), either flood to settle the land or let it lie four or five weeks to settle. Then cultivate and harrow. I inoculate seed.

4. I have had best results by sowing in April. Sow sixteen to eighteen pounds. I broadcast before the disk or cultivator about eight to ten pounds of seed and the same amount crossways after the cultivator. I buy seed only from firms that guarantee it to be free from dodder or other obnoxious weeds. It is difficult to get pure Turkestan seed. I do not plant nurse crop.

5. I disk once a season. I have applied gypsum and fertilizer about one hundred pounds per acre. Satisfactory temporary results.

6. The first cutting has some foxtail. We cut it early and feed it to the stock.

7. If the meadow is cut each time as the new shoots appear at the crown, we can get six cuttings.

8. We feed most of our hay to our dairy stock. We pasture all the year. We do not have much trouble with bloat if we leave the cows on the pasture day and night.

9. Gophers and squirrels are our worst pests. We keep a sharp lookout and kill all we can when irrigating.

10. Our oldest alfalfa is in its fifth season, and is as satisfactory a stand as the youngest.

11. We have never grown alfalfa between orchard trees. However, we planted some trees in an alfalfa check and results are not satisfactory.

12. We cut when the basal shoots start to grow, regardless of whether alfalfa has commenced to bloom or not. The time between cutting and stacking depends upon the weather. Early in the season I let the hay lie a day before raking and then in the windrow a day. When the heavy dews are over and the warm weather comes, I rake as soon after mowing as the rake will pick it up, usually about two hours after cutting, and get it into the cock as quickly as possible. You cannot rake so close to the mower when fertilizer has been used. The hay should be stacked any time after it has cured enough (when you twist a stem, sap does not appear). It is not necessary for hay to be bone dry before stacked. I have used caps (and lime) in Illinois, but not in California.

**Geo. N. Castle, Tulare.**

1. I grow the common variety.

2. For irrigating I build the contours four tenths above the level of the land.

3. Plow and harrow till the soil is thoroughly pulverized. Have never used bacteria or inoculated seed.

4. We sow any time from November to March 1st, using about fifteen pounds of seed to the acre, and broadcasting., Do not screen seed nor plant nurse crop.

5. Disk early in the spring. Never used any fertilizer.

6. We cut the first crop containing foxtail just as the foxtail is heading, cure as quickly as possible and stack.

8. Feed on the place. Pasture at times when not expecting to cut for hay. It is better not to pasture at all.

9. Have not discovered any pests.

10. Use same land for five or six years, then change to grain for a year or two.

11. Have never grown alfalfa between rows of trees.

12. For dairy purposes, cut before blooming; for horse feed, cut when well in bloom. Rake as soon after cutting as possible to cure. Have never used any caps for cocks.

**Will Higdon, Tulare.**

1. I grow the common variety. Turkestan doesn't do well here.

2. In irrigating I build the checks one to two inches high as it is only eight or ten feet to water here.

3. I give the ordinary plowing and harrowing. The land here is naturally adapted to alfalfa raising so needs no inoculation.

4. I sow fifteen pounds of seed to the acre, either drilling or broadcasting. Do not screen seed. Plant nurse crop if seeding early.

5. Do not disk. Have not applied lime or fertilizer.

6. The first cutting is usually mixed with foxtail.

7. Cut five or six times.

8. Very little troubled with bloat.

9. Drown gophers in irrigating.

10. Several fields here have been sown twenty years and have good stands yet.

11. Have never grown alfalfa in orchards.

12. In hot weather the rake usually follows right after the mower. We stack the old way with hand forks. Small stacks will not heat. We use no covers here for hay.

**H. T. Anderson, Visalia, Tulare County.**

1. I have always grown the common variety until this season when I sowed ten acres to Turkestan. I have a nice stand on the land from less then eight pounds per acre.

# With the Citrus Growers

## AS OTHERS SEE US.

MOST interesting reading is given to Californians in the reports of the various commitees of Florida orange growers who visited this state a few months ago. These reports were all made at the meeting held at Tampa, and almost to a man they join in commending the spirit of boosting and standing together which prevails among California fruit growers. Especially would we call attention to the last sentence of the following report which the committee on organization submitted. We quote very largely from this committee's report because it gives an idea of an outslder's view of our methods, and should be an encouragement to Californians to go on and perfect that which is now accomplishing so much. The following is from the report.

After due investigation of the corporation laws of the State of California, under which the Fruit Growers' Exchange is organized, we found that in order to bring about the same or similar organization in Florida, it was necessary to secure from our legislature, now in session, the passage of a corporation law similar to the California law. In other words, we found that under the present corporation law of Florida, we could not accomplish the purpose of the California organization.

Under the California law, the Fruit Growers' Exchange and the corporations under it are organized not for profit, but for mutual association, and under the provisions of that law the stock issued in these associations is not assignable by the owner without the consent of the association, and can not be sold for his indebtedness, nor does it pass to his administrators, as the general laws requires in ordinary corporations, but it becomes an asset of the land, on which his grove is situated, and passes with the ownership of the grove; in other words, it does what is generally designated in the law in similar cases—runs with the land.

Again by their enactment of the California law, they have avoided all danger of conflict with the anti-trust laws of the general government. These considerations being so weighty, and of such vital importance to our successful organization of the orange growers of this state, we thought it best to, and did immediately copy the California law on this subject, only changing its terms so as to fit our conditions, and immediately sent one copy of this law, or intended law, to the senate and another to the house of representatives of the state of Florida, requesting the immediate passage of one of them. We regret to state that up to the present we have been unable to secure the passage of the same; we are, however, still hopeful that one of these bills will yet be passed and become a law, and thus give us an opportunity of organizing this state on the same basis and under similar laws to that of California.

### Legal Standing of the Exchange.

We find that the California Fruit Growers' Exchange and the system upon which it is organized, contemplates and brings into existence three different classes of organizations, built up like a pyramid, the one resting upon the other.

At the foot of this pyramid and forming its very base, are the various fruit growers' unions; they are, as a rule, corporations, though not necessarily so at all times. They are known and termed associations of growers, or units, and reach directly the growers who compose it. These units are formed in each neighborhood, considering only the convenience of the growers.

As a general thing there is but one share of stock issued by the association to each grower, which share of stock is predicated upon his holding of orange property, and is an adjunct to such property, and the ownership of it passes with the land.

### Sub-Exchange.

The sub-exchanges are separate corporations from the associations above described, and are composed of groups of such associations of growers, and are located in the most convenient territory to the associations that compose them; one share of stock of the sub-exchange is issued to each association of growers, which entitles each association to one director in the exchange, this share of stock being usually held by the particular director elected by the association to represent it. The sub-exchanges are located in some central community convenient of access to all of the associations that compose it, so as to be in touch with the associations and act as a means of communication from them to the central exchange, and at the same time be in close communication by telephone and telegraph with the central exchange.

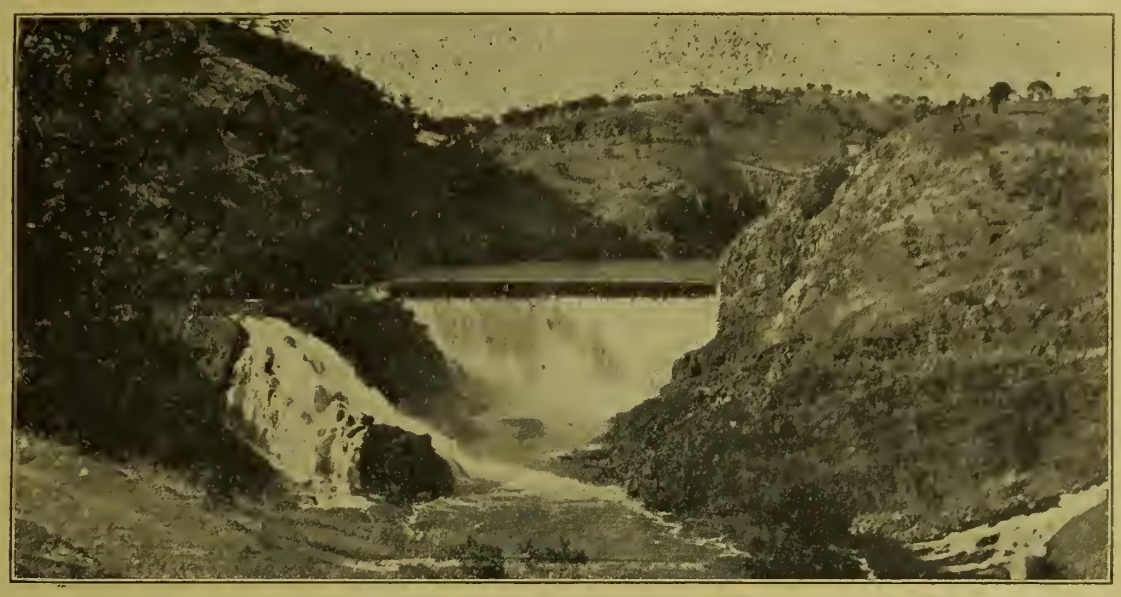
Coming on to the apex of the pyramid, as above described, we now reach and deal with the

### Central Exchange,

Or clearing house for the fruit itself. This, in the case of California, is located at Los Angeles. One share of stock of this, the general exchange, is issued to each sub-exchange; no more and no less. This entitles each sub-exchange to one director in this general exchange or clearing house, and these directors so elected, one by each sub-exchange, compose the directory and absolutely control the entire shipment and placing of the fruit of all the growers, who, through the associations and sub-exchanges, compose it, and this clearing house directly reaches the growers in the transaction of their business, through the sub-exchanges and through the associations of growers, down to the growers themselves, thus placing the growers at all times in direct touch and communication with the exchange handling their fruit. This clearing house or exchange handles all the fruit turned over to it by the associations, through the sub-exchanges, and at the same time and on the other hand is in direct touch with the buyers of the fruit at the other end, and entirely directs the sale and distribution of the fruit through its agents in the markets.

Another adjunct of the exchange or clearing house is to act as a purchasing agency of supplies for the growers, which has proven very satisfactory to the growers there, for by purchasing all their packing supplies and fertilizers in bulk they have been able to save to the growers for whom they act in this capacity tremendous sums of money. In fact it is demonstrated that the saving to the growers in this particular alone more than pays

the entire expense of the marketing of the growers' fruit. Again this clearing house acts as a collecting agency for the growers, takes up and handles all claims of growers against the transportation companies for any damage to the growers' fruit, and by putting the force of this organization behind these collections, has been enabled to collect practically all of these claims from the transportation companies without suit, thus again saving to the growers vast amounts of money that might be expended otherwise for such suits. None of these corporations composing this system are organized for profit, but, on the contrary, the entire question of profit in the handling of the fruit, and its marketing has been eliminated, for while the general exchange charges the growers a reasonable amount for marketing the fruit sent through it, all of this sum so charged and collected from the grower is used in paying the expenses of the employes hired, on salary, to manage the business of the exchange and to meet other necessary expenses of the marketing of the fruit, and, if after so doing, any of the funds thus collected from the growers remain in the hands of the exchange, such funds are, at the end of the season, pro rated back to the growers, through the sub-exchange and association, according to the number of boxes shipped through the exchange by each grower, thus making this system, in our judgment, and as far as human foresight can possibly render it, a complete and perfect system, and one we most heartily recommend for the adoption of the orange growers of Florida, it being impossible in our judgment to conceive a more perfect organization.



La Grange Dam, Source of the Great Turlock-Modesto System.

### THE ARGENTINE ANT.

From an account in the San Jose Times on the work of the Argentine Ant, which some months ago was referred to as offering a possible menace to our fruit industry, we quote the following:

"L. H. Day, the man who is at the head of the investigation in the Argentine ant situation in connection with the Agricultural Station of the University of California, was in town yesterday in conference with County Entomologist Earl L. Morris looking over the conditions in San Jose.

These two men have been working hand in hand in this matter, as is the practice of the county entomologist and the university authorities in all of the work they are jointly interested in. Mr. Morris has been looking for some practical method of eradicating this pest, while Mr. Day has been making an exhaustive investigation into the life history of the pest and in this way trying to find some method of control.

Although his work has been carried on but about three months, Mr. Day has come to some conclusions that he feels will be of benefit in getting at the bottom of this perplexing problem.

During the past three weeks this investigator has been watching the work of a small colony he has in his laboratory and has found that in this time the queens, which are very plentiful are laying from 30 to 60 eggs each day. How long this process will continue can only be guessed at, as this is the first season that any definite work has been undertaken by the university authorities in this direction. He has also found that they do not break up in small colonies as do the native ants, but gradually spread out in one great community.

The most frequent method of spreading from one section of a city to another or from one part of the country to another is by means of potted plants and through fertilizer, both of which, the investigator declares, are perfect methods for the spread.

A very large interest is being taken in this work by the university authorities, who hope that it will not be long before some definite campaign can be waged against this pest."

### COVER CROP IN THE ANTIPODES.

The most efficient substitute for stable manure is a leguminous crop plowed into the soil early in spring before severe evaporation begins. The crop generally cultivated for the purpose is the field pea. The plan of cultivation for the complete fertilization of fruit-growing land which is now generally adopted in districts in Victoria remote from a supply of farmyard manure is as follows: The ground is broken up after the crop of fruit is gathered, and cultivated to form a good seed bed. Peas are sown, in drills or broadcast, with superphosphate at the rate of 2 cwt. per acre. In some cases sulphate of potash, at rate of 1 cwt. per acre, is added after the peas are sown and lightly harrowed in, it being accepted that a supply of this manure is necessary, especially in light soils. In early spring, the crop of peas is plowed in and the soil well cultivated to produce a level well pulverized surface. By the means stated vegetable matter, nitrogen, phosphoric acid, and patash, are added to the soil, thus furnishing the most important fertilizing substances, and improving, by means of the vegetable matter, the physical condition of the soil.—Journal of Agriculture of Victoria.

Wounds on fruit trees of any considerable size should be given a coating of paint or some other durable substance. A suitable dressing must contain two distinct properties. It must check the drying of the wound and prevent the growth of bacteria and fungi, and it must be of such a nature as not to injure the surrounding bark. For general purposes, a white lead paint is most satisfactory.

The past month has been exceedingly favorable to the increase of many insect pests in Madera county, and the orange thrips especially is reported very destructive.

## PECANS IN TEXAS.

GREAT interest is being created in Texas in Pecan Growing. It is a tree which requires years to come to full maturity, but its profitableness is such that it pays for the waiting.

A few hours before the late Governor Hogg's death, he said: "I want no monument of stone or marble, but plant at my head a pecan tree and at my feet an old-fashioned walnut * * * and when these trees shall bear, let the pecans and the walnuts be given out among the plain people of Texas, so that they may plant them and make Texas a land of trees."

A noble sentiment which will attract atention of Texas growers to the advantage of tree planting.

Like nearly all other trees the pecan does not come true to seed, so that budding or grafting is necessary for uniformly good fruit.

### Budding.

The following read before the late convention of Texas Nut Growers gives of the experience of Mr. Fernando Miller in budding:

If we are to be successful in budding, there are certain requirements which we must necessarily heed and none is of more importance than the selection of the buds. Nearly all the pecan budding done heretofore has been accomplished with buds taken from shoots of the current season's growth. There are those who still hold to the opinion that these buds are best, but my experiments have proven to me at least, that the older ones are much preferable. The government expert at Washington, Mr. Oliver, whom I believe was the first to recommend the use of these dormant buds might have gone farther and urged the use of all dormant buds regardless of their age instead of stopping with recommendation of those of the previous year's growth. These dormant buds ranging in age from one to several years, may be seen on any pecan tree at any time of the year, and I believe their proper use in budding will revolutionize the propagation of pecans.

It has been my experience that June is the best time for pecan budding, and at that time of the year the new shoots have made considerable growth and for every stick of dormant buds we must cut off a new shoot. Since buds of fine varieties of pecans are very scarce, not nearly enough to supply the demands for them, it surely would be advantageous if we could use these new buds successfully.

If the leaves on the young shoots are clipped off just where they begin to spread, leaving the leaf stalks about three or four inches long, it will be found that in two or three weeks these leaf stalks will have been so prepared by nature's laws that the buds found near them may be used successfully. The treatment above referred to should be continued throughout the months of April and May and by the middle of June from one-half to two-thirds of the buds on each shoot may be developed to the extent that their use in budding will be followed by satisfactory results. I sincerely hope that those who are interested in pecan budding and who have access to pecan trees will try this experiment, for if it proves a success with others, it would assist materially in the pecan growing industry.

There has been so much written and spoken on the various methods of pecan budding that I feel anything that I might say on this part of my subject would add nothing to the stock of knowledge already at hand, but will say in this connection that I have budded pecans from March to July, inclusive, and as already stated, have found June to be the best time, for it is then I have found everything to be in the best condition for that operation. Pecan trees which have been topped in February will, by June, have grown shoots large enough to bud and besides the shoots on trees topped the previous year are then not too large to be budded. It is my opinion that no one, however skilled as a budder he may be, will ever have satisfactory results if he is to depend upon his buds coming through the mails. The first step then to be taken is to have a few bearing pecan trees coming on one's own grounds so that the buds can be got fresh from the trees, unless it be in an effort to get a start of a new variety.

## ORCHARD FERTILIZERS.

Fertilizers are but one of several factors that affect success in orcharding. The others include varieties, location, soil management, spraying, pruning and general orchard care.

The best orchard treatment probably consists in the discovery of the crop-limiter, the elevation of it to the level of the other factors, and the maintenance of a proper balance in the treatment thereafter.

In some orchards fertilizers and manures are the limiting factor, while in others it is something else. Hence, in general, it is questionable whether they should be applied in large amounts, until the orchardist has evidence that they are needed.

The need of a fertilizer is indicated by the trees being deficient in growth, foliage, or fruit, after the other factors are apparently right. Under these conditions applications of manures and fertilizers can scarcely fail to produce beneficial results.

The indications are that nitrogen has more value as an orchard fertilizer than is generally accorded it. It should be used judiciously, however, on account of its effect on color. It can be used most freely on the earlier soils or in localities with rather long growing seasons. It is probable that failure to secure results on apples from the application of potash and phosphates may often be due to a deficient nitrogen supply, which thus becomes the limiting factor for that orchard. If applied in the nitrate form, the time of application must be right.

The greatest actual improvement in value of fruit has been secured on plots receiving phosphoric acid and potash in the form of low-grade sulfate. The exact cause of this is not yet known.

Where plant-food is needed, we cannot improve upon the general recommendation of stable manure (about 10 T. per acre) or leguminous covercrops, alternated with a fertilizer carrying about 30 pounds of nitrogen, 60 pounds of prosphoric acid, and 100 pounds of potash per acre.

To accompany this system of fertilization, the indications are that the proper soil management for most situations is tillage with a leguminous cover crop while the orchard is young, followed by a mixed grass and leguminous sod or sod-mulch when bearing age and size is reached. After the bearing habit is established, a return to tillage every second or third year should be made, increasing the frequency of tillage with the age of the orchard and the demands of the fruit.

Current orchard practice may be improved by the owners adopting the methods apparently best for their orchards as a whole, and then maintaining some parts for experimentally determining whether the methods chosen are really best for their conditions.—Penn. Exp. Sta.

## CIRCULATION OF AIR IN SOIL.

A proper circulation of air in the soil is just as important as any other factor of plant growth. Nearly half of the volume of ordinary soils is occupied by air spaces. The air spaces in the soil wind in and out between the soil particles as they do in a pile of larger stones. If the layer of water on the surface of the soil grains becomes so thick as to stop the air passages here and there the soil is then too wet for most crops and needs drainage.

Plants have no special breathing organs, the oxygen required in their breathing finding entrance all over the surface of the plant. Plant roots must therefore be supplied with air, and hence the soil must be porous enough to permit of free circulation of air. A good supply of humus and proper tillage will accomplish this result in clay soils. Sandy soils are usually too porous, needing humus to help them retain water.

Another reason why air must circulate freely in the soil is that large quantities of oxygen are required to insure proper decay of organic matter to supply plant food. Also, carbonic-acid gas is produced by the decay of organic matter, and this must escape easily to make room for the atmospheric oxygen needed in the soil.

The movement of air in the soil is frequently shown by the bubbles which appear at the surface of the soil just after a hard rain. As the water soaks into the soil it drives the air out, and bubbles may be seen at the surface if water enough is present to form them. One of the most important objects of plowing is to loosen up the soil and mix fresh air with it.—Farmers Bulletin.

Mr. G. P. Rixford of San Francisco, under direction of Walter T. Swingle of Washington D. C., in charge of office of Plant Industry, is in Loomis superintending the shipment of Capri figs from the E. W. Maslin Seedling Fig Orchard to growers of Smyrna figs. There are 152 trees in this orchard, half of which are Capri. Any grower of Smyrna figs wishing further information may write to J. P. Rixford, 1813 Pierce St., San Francisco.

The Salinas Valley has already cut nearly 100,000 tons of hay.

# Live Stock and Dairy

By Mrs. Minna E. Sherman

**Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.**

## ACIDITY OF CREAM ON THE FLAVOR OF BUTTER.

IT HAS BEEN a generally accepted theory among teachers of and writers on dairy subjects that the production of good butter necessitates the development of a certain amount of acid in the cream, for two reasons—to develop a desirable flavor and to improve the keeping quality. Recent investigations by the United States Department of Agriculture indicate, however, that butter made from pasteurized sweet cream has better keeping qualities and remains free from objectionable flavors for a longer time than butter made from sour cream.

The Dairy Division of the Bureau of Animal Industry for the past three years has been making a study of the changes which butter undergoes in storage, and especially the influence of acidity of cream on the keeping qualities. This was done to determine the best method of making butter for storage. The investigations have been carried on by Messrs. L. A. Rogers and C. E. Gray, and included the making of experimental lots of butter by different methods and in different parts of the country. This butter was kept in cold storage and was examined and scored at certain intervals, the scoring being done by men who had no previous knowledge of how, when, or where the butter was made, so that their conclusions were based strictly on the quality of the butter. A report of this work has just been issued as Bulletin 114 of the Bureau of Animal Industry.

As a result of the investigations it was found that butter frequently undergoes marked changes even when stored at very low temperatures, and that these changes are more marked as the acidity of the cream from which the butter is made is increased. No bacteria were found in the cream or the butter which could reasonably be expected to be the cause of the more rapid deterioration of the high-acid butter. Furthermore, the changes in the high-acid butter were not checked by heating the ripened cream, which shows that they were not brought about by enzymes secreted with or in the cream and carried into the butter. The results also indicated that acid which develops normally in the cream by the action of certain bacteria, or which is added directly to the cream in the form of pure acid, brings about or assists in bringing a slow decomposition of one or more of the compounds of which butter is largely composed.

What is regarded as of special importance is the fact that butter can be made commercially from sweet pasteurized cream without the addition of a starter. Fresh butter made this way has a flavor too mild to suit the average dealer, but it changes less in storage than butter made by the ordinary methods, and can be sold after storage as high-grade butter. At present time there are at least ten creameries in the country making butter from sweet pasteurized cream without a starter, and many more with a starter but without ripening. The statements in regard to butter from unripened pasteurized cream do not hold for butter made from unpasteurized cream churned without ripening. Butter made in this way has poor keeping quality.

Butter for the United States Navy is being made from sweet cream, and this plan, adopted last year, is giving satisfaction. A tub of sweet-cream butter 14 months old on exhibition at the National Dairy Show last December had no storage or fishy flavor, and was pronounced a fine article.

## CO-OPERATION IN DENMARK.

J. H. Murad writes from Copenhagen to Hoard's Dairyman about co-operation in Denmark. There are all manner of co-operative societies in Denmark for all sorts of purposes, including savings banks. These societies have existed for many years, but real progress began only about 1866, and that was upon the pattern of the English "Rochdale" societies. Mr. Murad, quoting from a recent Danish history of co-operation in Denmark, says that there were forty-four associations in 1879; 108 in 1875; 837 with a membership of 130,331 in 1898, and 1188 with 168,699 members in 1908. The principles on which the best associations were started were those of the English, as follows:

1—Any one may become a member whether he is poor or rich, or whatever social position he occupies.

2—Every member has but one vote irrespective of the size of his investment.

3—The working capital is provided by the members, who receive a reasonable interest, say 5 per cent, on it.

4—All buying and selling is done on a cash basis.

5—The goods are distributed at the ruling common retail price.

6—The net profit is divided among the members in proportion to their purchase during the year.

7—The members conduct and control the business through a not too small directory and by auditors not members of the directory.

These associations do, in the aggregate, a very large business, but the stores can not, of course, compare in volume of trade with the much larger establishments of Great Bitain, but the aggregate trade of the stores in 1907 was $39,837,373. Their management, however, is exceedingly economical, the working expense in 1907 being but 2.15 per cent of the total sales. The failure of most American associations is due to the disregard of most or all of the following principles, which are supposed to govern all Danish co-operative stores, and especially to ignoring the fundamental principle that all purchases and sales must be for spot cash:

1. Appoint as distributer a man who understands and is interested in the problem and who has a trade training, at best in a consumers' association or if he lacks this give him an assistant who has such training.

2. That he gives a sufficient and satisfactory bond for what is confided to him.

3. That he is not acting as book-

CONGO ROOFING | GUARANTEED BY A SURETY BOND

TO CONVINCE the public that 3-ply Congo Roofing will really last **ten years,** we furnish with every roll a bond of the National Surety Company backing up our guarantee.

THIS BOND gives you absolute certainty that our promise will be made good.

WE DON'T CONSIDER that the bond is necessary, but it serves to show how firmly we believe in the **durability** of our product.

ANY MANUFACTURER could say as we do, that his roofing will last ten years, but we show that we mean business when we **back up** the guarantee with a genuine Surety Bond.

THE ONLY THING for us to do under these circumstances is to make a roofing which will stand the test, and outlive the guarantee period.

**That is what Congo will do.**

OTHERWISE, we could not afford to bind ourselves over to a Surety Company, and thus insure the thousands of Congo roofs which are being laid every year all over the country.

**FREE SAMPLE**

WE SHALL BE GLAD to send you a copy of the bond without charge. We will also send you at the same time a sample of Congo, so that you will see the reason for our confidence.

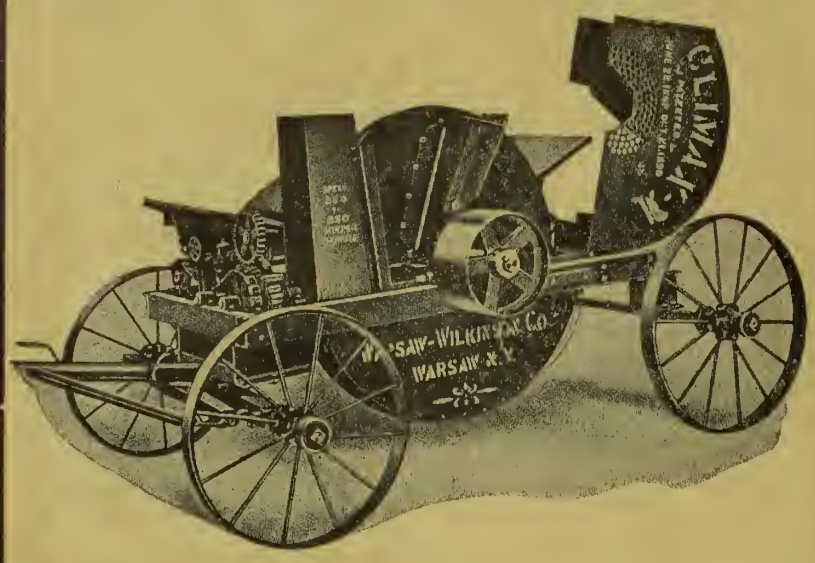
Pulp on sale at $1.25 per ton from silo. In use for more than a hundred years, it is conceded to be the *cheapest* and *best* dairy feed known. Also Molasses equal to corn, pound for pound, $1.50 per barrel.

**Los Alamitos Sugar Factory, Los Alamitos, Cal.**

# Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequaled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage. We received at the

**St. Louis Fair the Only Award**

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half lengths, other feed in proportion. For further particulars, call on or address

# Tanks Tanks

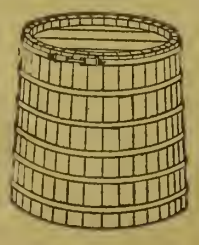
**WINDELER'S PLANING MILL AND COOPERAGE**

GEO. WINDELER, Prop

Water Tanks, Wine Tanks made from carefully selected stock by careful and experienced workmen. "Tanks that are well made last a long time." It will pay you to get my prices before buying.

**Geo. Windeler**

*Wine Tank* 144-154 Berry St. San Francisco, Cal. *Water Tank*



keeper at the same time. The directors should, jointly with the distributers, buy the stock and secure the best terms possible so that there is no chance of bribery.

4. At best the bookkeeper should not be cashier.

5. The directors should actively control the business and take stock carefully at least twice a year.

6. The directors should invariably investigate, every month, the liabilities to the joint association and see that they correspond with the book.

7. The auditors should be elected with a view to their actual competence to audit the account; they must know and have had practice in bookkeeping.

8. The association must absolutely not give credit to the members. If it is permitted the distributer (at his own risk, of course,) to give a little credit, it must be limited and only for a short time and he should be fined if he exceeds it. When the accounts are made up he must invariably have collected all that's due from the members. If he is permitted to give credit his bond must be twice as large as the highest amount of credit which he is allowed to give. Of course, those who get credit must pay interest in justice to the other members. But the ideal system is not to allow any credit whatever; indeed some associations fine the storekeeper if he delivers any goods without cash payment, and thrive well.

9. The associations must have enough working capital to pay cash for the stock; at least half the Danish associations do not have enough and are prevented from securing the benefits of cash buying; members oppose the securing of enough capital, but are content to let the association assume liabilities to their trade connection; they forget that they are equally solidary responsible for such debts as for regular time loans, the size of which they knew and the interest on which is much lower than on the floating liabilities.

The members of the Danish associations are solidary responsible, as understood by the old Roman law, so that a creditor may make execution in the property of any one of the members for the whole amount, leaving him to collect from the others. This makes it much easier to obtain credit at low interest, but is pretty tough on the victim selected.

## INCREASING PREVALENCE OF ANIMAL TUBERCULOSIS.

The reports of the Bureau of Animal Industry of the United States Department of Agriculture indicate that tuberculosis among live stock is steadily increasing, as shown by the number of animals found affected at the various slaughtering centers. The increase in the number of cases found is due in part, but only in part, to the increased efficiency of the method of inspection. The meat inspection figures show that nearly one per cent of cattle and over two per cent of hogs slaughtered are tuberculous, which is surely an alarming condition.

Feeding experiments conducted by the Bureau have proved conclusively that hogs are readily infected through the ingestion of feces and milk from tuerculous cows. There is therefore no doubt that the prevalence of the disease in hogs could be greatly reduced simply by eradicating it from cattle.

Considerable testing of cattle has been done in Washington, D. C., and vicinity for the purpose of assisting the District authorities in obtaining a pure milk supply, and of obtaining for the Bureau further information regarding the extent of tuberculosis in the locality and for other purposes. In these tests about 17 per cent of the dairy cattle reacted.

The percentage of tuberculosis in various States, shown by tests conducted by the officials in those States with Bureau tuberculin, indicates that from 2.79 to 19.69 per cent of the cows react, and it is estimated that in the country at large at least 10 per cent of the cows in dairy herds are tuberculous.

The recent agitation against the milk of tuberculous cows as human food has had the effect of causing many herds to be examined, with astonishing results not only to the owners but to the officials themselves. Can it be wondered at that so many infants and children die of intestinal tuberculosis when so many of the cows from which milk is obtained are tuberculous?

Without considering the matter as a public health question, but looking at it entirely from an economic standpoint and as a business proposition, live stock raisers can not afford to have tuberculosis in their herds. As an illustration, Argentina requires that all cattle imported into that country shall be subjected to the tuberculin test upon arrival, and as a consequence exporters from the United States have had the test made on cattle intended for shipment. The results of these tests showed that in some of the purebred herds nearly 50 per cent of the animals were diseased and in consequence sales were lost.

When the practice becomes general for all buyers of breeding cattle to have animals tested before placing them in their herds the breeder of strictly healthy cattle will be much sought after. Already some breeders of purebred cattle have established or are arranging to establish such herds. As soon as the breeders fully understand the fact that it is unprofitable to go on breeding cattle while tuberculosis exists in their herds much of the objection raised against the sale of live stock subject to inspection will disappear, for it would be worth the price of several condemned animals for the owner of a valuable herd to know the fact as early as possible if the disease exists in his herd, as the longer he delays in taking steps to prevent its spread the greater will be his loss eventually. Figures for the last year secured from abattoirs where Federal inspection is maintained show that over 10 billion pounds of meat was inspected, 46 million pounds of which was condemned, nearly three-fourths being for tuberculosis.

The recent effort of the large packing interests to buy all dairy cows subject to postmortem inspection shows how serious the plague is becoming. Sooner or later the man who raises tuberculous animals must suffer the loss, unless the loss is paid for out of public funds; and when the loss is placed upon the producer we may then know that the end of the disease is in sight.

It may at some time be necessary for the Federal Government to quarantine against interstate shipments of cows from certain States where the

disease prevails to a considerable extent, and require a strict supervision over all animals removed from such States for interstate shipment, and only remove the quarantine from sections of the State when it has been demonstrated that the disease either has been eradicated or is under strict local quarantine.

## SHEEP SCAB AND TREATMENT.

Sheep scab is caused by the presence on the skin of a mite. This mite is white in color and somewhat difficult to see, but it may be seen with the naked eye and easily with a magnifying glass. On the skin of the sheep it propagates rapidly, especially when the wool is long. By feeding upon the skin and poisoning it with its excretions, it causes the characteristic symptoms of the disease. The scab mite propagates by having eggs. The eggs hatch in seven to nine days, and the young come to maturity and are ready to lay eggs at about the 14th day. Sheep affected with scab distribute the mites on everything with which they come in contact. The barns and sheds which they occupy, posts or trees in the pasture, stockyards and stock cars are common carriers of the mite from diseased to healthy sheep. A flock of sheep may become affected with the scab mite from wool sacks in which wool from scabby sheep had been previously shipped. The scab mite does not propagate at all nor thrive well off of sheep. It is killed by cold and drying. It is generally believed that it does not live off of sheep for more than three or four weeks. Observations, in this state, indicate that in a few cases it has lived in vacant premises from spring to fall. At any rate, it is not advisable to use infected premises for healthy sheep or those that have been dipped again for at least 30 days in winter and for a longer period in summer.

Scabbies, being easily cured, is kept well under control where sheep are handled in small lots on farms. It is widespread on Western ranges, where its eradication is naturally more difficult. The outbreaks of scab among sheep in this state are most common in the wild outlying ranges, or on sheep-feeding farms. In the latter case, the sheep for feeding purposes are shipped from infested areas in the West and Southwest or become infested in transit. In this way about nine tenths of the total number of outbreaks in this state have been caused. The loss from sheep scab is great only when the treatment is neglected. The disease is easily cured and may be stopped before any loss is sustained, aside from the cost of dipping. If neglected, however, it will spread, especially during the winter, to such an extent as to cause the complete loss of wool off of the entire flock and cause great debility of the sheep and sometimes more or less deaths.

The first symptoms of the presence of scab is restlessness and some scratching. Unless the flock is closely observed, this may be overlooked. More violent rubbing, biting and pulling out tufts of wool follows. As the disease progresses, patch after patch of wool falls away until the whole fleece is lost. The bare skin is covered with a wrinkled crust, which, on folding, cracks and bleeds. The affected sheep rubs continually. It loses in condition as the disease advances. After sheep are sheared in the Spring and the skin exposed to the hot sun, the symptoms subside to some extent. In some cases the herd appears to be almost well during the summer months. On the approach of cold weather, however, the symptoms return, and if the disease is neglected during the winter, there will be a heavy loss of wool and more or less loss of sheep by death.

Now and then one or more sheep in a flock will shed a part or even all of the wool without any known cause. When there is no scab mite infection, this shedding usually stops with one or two animals. In case there is any doubt about the cause of the trouble, a careful examination of the skin for the scab mite should be made.

The scab is easily cured by proper dipping. The most reliable dips are lime and sulphur and tobacco and sulphur. The patent dips have been found inefficient as far as experience in this state has gone. The Beaumont crude oil emulsion has been found very efficient in curing scabies in cattle. As the mite causing sheep and cattle scabies differs only very slightly, it is possible that this emulsion may be very effective in curing sheep scab. In case it proves to be harmless, it is almost certain to become a popular dip for sheep. It is thought worth while to include the directions here for its preparation, as found most effectual in curing cattle scabies in the West.

### Lime and Sulphur Dip.

Flowers of sulphur.....24 pounds
Unslaked lime ..... 8 pounds
Water .....100 gallons

Preparation.

First—Weigh and measure the ingredients accurately.

Second—For each 100 gallons of dip desired place eight pounds of unslaked lime in a large kettle and add enough water to slake it and to make it into a paste.

Third—Sift into this 24 pounds of sulphur and stir well.

Fourth—Add 25 or 30 gallons of water and boil for two hours or until the sulphur disappears from the surface. Add water if necessary.

Fifth—The lime is injurious to the wool, and if sheep are to be dipped while carrying the fleece, the following precaution should be taken: Place the solution in a barrel and allow to stand until the sediment has settled. Then carefully draw off the solution without stirring up the sediment. If sheep are to be dipped just after shearing, this precaution need not be taken.

Sixth—To the solution thus obtained, add enough water to make 100 gallons.

### Tobacco and Sulphur.

Tobacco leaves .....1 pound
Flowers of sulphur.....1 pound
Water .....6 gallons

First—For every six gallons of dip needed place one pound of good leaf tobacco in cold or lukewarm water and allow it to stand 24 hours. On the evening before dipping bring this to near the boiling point for an instant. Then remove the fire and allow the infusion to stand over night.

Second—Thoroughly mix one pound of sulphur with the hand in a bucket of water to the consistency of gruel.

Third—When ready to dip, strain the tobacco infusion, mix it with the sulphur gruel and add enough water to make six gallons.

### Crude Oil Emulsion.

Water .....4 gallons
Soap .....4 pounds
Beaumont crude oil.....1 gallon

Preparation.

First—Shave four pounds of soap in four gallons of soft, hot water and stir until it dissolves.

Second—Slowly add one gallon of Beaumont crude oil and stir violently until the oil is cut and mixed with the soap suds. A large churn may be used for this purpose.—Dr. D. F. Luckey, Missouri State Veterinarian.

# Small Fruits and Vegetables

## THE LIFE HISTORY OF THE CUT-WORM.

AT THE beginning of the growing season the gardener often finds in the morning young plants cut off near the surface of the ground that the evening before were strong and healthy. On stirring up the soil near by he may find hidden in the ground a greasy-looking caterpillar, the culprit in the case. Cutworms, so called from this habit, are the caterpillars of dull-colored night-flying moths of a great variety of species and varying to some extent in their habits. As a general rule they are partly grown at the approach of winter and hide away in a torpid state during the cold weather; when restored to activity by the warmth of spring, which causes the buds to open and the growth of plants to begin, these worms come out in search of food and attack any kind of tender vegetation that they meet with. They are nocturnal in their habits and hide away during the hours of daylight under any shelter they can obtain or just below the surface in the loose soil of newly made beds. Owing to their destructive practice of cutting off a whole plant in order to devour a portion of its foliage, they do a great deal of apparently needless damage.

After they have become fully grown they change to the chrysalis stage in the ground and in early summer the moths appear, many of them making their presence known in our houses by their attraction to light. Before very long another brood of caterpillars comes upon the scene, often more numerous and more destructive than the first. Some of them climb up into fruit trees and destroy the foliage, others attack farm crops, vegetables, grape vines, the plants in flower gardens, etc., while occasionally a single species appears suddenly in enormous numbers and sweeps like an army over the land devouring everything that comes in its way.

Happily a very simple and completely effective remedy has been found for these destructive creatures. It is called the "poisoned bran-mash" and is made in the following manner: Mix half a pound of Paris green in 50 lbs. of bran (the proportion for larger or smaller quantities is 1 to 100); the poison should be added to the dry bran little by little and stirred all the time till the whole is tinged with the green color, then add water sweetened with sugar or molasses, till the mixture is sufficiently moistened to crumble nicely through the fingers. If bran cannot be procured, shorts or flour may be used, and for field work may be distributed dry by means of a seed drill. The mash should be scattered in the evening about the plants that are liable to attack, and strange to say the worms will devour it in preference to their ordinary vegetable food. When they begin to feel the effects of the poison they wander off to find a hiding place or burrow in the ground and there die. Their dead bodies will be readily found in the morning just below the surface of the ground, often in surprising numbers. Young plants, such as cauliflowers, tomatoes, etc., may be protected when set out by wrapping a bit of newspaper around the stem between the root and the leaves and reaching a little below the surface of the ground. The worms will not attempt to bite through or climb over it.—Canada Fruit Grower.

## THE IMPORTANCE OF PLANTING GOOD SEED.

SUCCESS in gardening depends upon many factors; one of the most important being the planting of good seed. By the term good seed we mean seed that when planted in good soil and given the proper care and attention will germinate well and produce strong and hardy plants. Very often a whole season's labor, as well as crop, is lost by planting poor seed. It is hardly necessary to define poor seed, but it will suffice to say that seeds are poor when they fail to germinate under good conditions. This failure to germinate may be due to the seed being too old or not fully matured. Old seed may be detected by their musty appearance and lack of bright color that usually characterizes good seed. Seeds that are not fully matured have more or less a dull color and are not plump.

As most of the seed that is planted by gardeners is purchased from dealers it is well to know something of the reliability of the firm and where the seed was put up and grown. A reliable seed house soon establishes a reputation for putting out good seed, consequently it is always better to purchase from such houses.

After the gardener has purchased his seeds he can be doubly sure of their quality by testing the different kinds. This testing can be done as follows: Take an ordinary china plate with a flat bottom, cut out from soft cloth two circular pieces the size of the plate. Thoroughly wet both, spread one over the bottom of the plate, and place on this one hundred seed of the kind that is desired to test and then put the other cloth over the seed. Cover the plate with a pane of glass and set where the temperature will be from 60 to 75 degrees. In a few days the seed in the tester will sprout and can be counted. By counting those that fail to sprout and subtracting from the whole number put in, the per cent of good seed can be determined.

If the results from any of the lots tested show a low per cent of germination it will be to the interest of the gardener not to plant that lot, but purchase new seed from a reliable source for his garden. In case it is inconvenient to buy new seed the old may be planted; but in doing this the seed should be sowed thickly so as to insure a good stand and allow for the number that will not germinate.

In connection with the above it is very important that the gardener plant his seed right. Before planting, the seed bed should be put into good condition and properly prepared. After doing this the seed may be planted, but do not plant them too deep. Many failures to secure a good stand can be attributed to this cause.

Small delicate seeds as the lettuce and celery, should be only slightly covered, while the stronger seeds, as peas and beans, can be planted deeper, say from one to three inches. After planting the seed it is necessary to apply water to the soil. Be sure to put on enough, and often enough to insure good germination.

A little forethought along these lines mentioned will greatly enhance the gardener's chances to secure a good stand of plants and reap a good crop.—J. E. Mundell, New Mexico College of Agriculture.

# The Ornamental Garden

**DESIRABLE HARDY FLOWERS.**

TREES and shrubs have certain utilitarian values aside from their power to afford satisfaction and pleasure with their beauty. With flowers the chief asset is this aesthetic quality. Nor should they be disregarded or neglected on this account. The farm grounds have need of them to add brightness and cheer, for flowers relieve monotony, introduce color and make gorgeous displays. Those plants that can be used for this purpose may be grouped under the following heads: Annuals, such as asters, marigolds, petunias and shirley poppies; bedding plants, such as coleus, geranium and heliotrope; and herbaceous perennials, like the iris, the oriental poppy, the peony and phlox. Of these classes the herbaceous perennials are the most satisfactory for the farm gardens and borders; for they are just as showy when in bloom as either of the other classes. If anything, they are easier to manage and need less care during the growing season. Then there is not the necessity for yearly renewal that there is with annuals and bedding plants. Yet this does not mean that we should disregard all save the herbaceous perennials. These should form the framework of the plantation and annuals should fill in open spaces to give variety and to insure bloom at seasons when the perennials have little to offer. The occasional use of a bedding plant like the heliotrope, the lemon verbena or the rose geranium, will lend added pleasure and charm.

In placing these plants it will be best to have them in borders. Sometimes, when there is great love for flowers and ample time to care for them, it will be desirable to have a simple garden. Never should there be detached beds scattered about the lawn; these disturb the restfulness and unity of the grounds, and are ill-adapted to a good display of our flowers. Borders are in reality long narrow beds, and may fringe shrubberies, skirt walks, or stand against the walls and buildings. The effectiveness of the display is enhanced if there is an appropriate setting or background, for there is need of a mass of green to relieve the bright colors of the flowers. By all means some of these borders should be so placed that the flowers can be enjoyed from the living rooms of the house.

Now it remains to discover the principles determining the number and disposition of the plants. First of all, have no patience with bare ground. There should also be a proper proportion between varieties. A single border should never be entirely given over to one thing, not even when there are a number of borders. There should be a nice proportionment and distribution of varieties. Likewise, especially in the garden, there should be some feature for each period of the garden season. There should be a predominant note with which all else is in accord. In this connection it is well to emphasize the need of continuous bloom. Then attention should be given to height graduation. Usually the tallest plants should be in the back and the lowest in the front. This arrangement permits the flowers of all to be seen to the best advantage and avoids the shutting in of smaller and weaker plants. However, we should not adhere too strictly to this, else there will result sameness and monotony. Occasionally the taller plants should come forward and the lower recede. In the final disposition and combination of flowers, color is a most important matter. There should be a pleasant distribution of color throughout the garden or border and there should be perfect harmony.

The soil should surely be as good as that of the kitchen garden. If necessary it should be replaced or ameliorated. It should always be abundantly supplied with plant food in the form of well-rotted barnyard manure.—St. Joseph Fruit Grower.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 46, 47.

## NOT A TRUST.

Referring to the effort on the part of the Imperial Valley melon growers to form a co-operative marketing organization, the Imperial Standard says: "With a crop into the production of which any firm can enter on six months' notice, it is impossible to create a trust such as that of the orange men, and the most that can be hoped for is to bring about a harmonious agreement between the parties in interest for the protection of the rights of all."

As to the fact of outsiders producing a crop on six month's notice, what the Standard says is probably true; what it says as to the orange exchange being a trust, we do not believe states the case as it should be stated. We do not believe the orange growers' organization is in any sense a trust or combination to boost prices.

In fact, one of its fundamental principles is delivering fruit for whatever the market will take it for. So far as we know there has never been a combination or effort to control prices. It is simply a class of business men organized to place their own product on the market so as to give returns to the owner of such fruit and not be jobbed in the deal. For over fifteen years this policy has been followed and its success is self evident. If the melon growers of Imperial Valley will put their industry on an equally business like basis, we believe they will be led out of the woods and secure more satisfactory returns, and the consumer will pay no more for the fruit he uses. This is proved to a certain extent by the fact that the consumers this year are paying no more, so far as we can see, for cantaloupes in the Los Angeles markets, than they did last year when the producers got not one penny. There is simply less juggling with the producer and consumer, and this will still further be reduced with co-operative methods of handling the fruit, the consumer getting the fruit at the least possible cost.

## HEREDITY.

In last week's poultry department was a short reference to egg production of the daughters of "200 egg" hens, which was based on results of experiments made at the Maine Experiment Station. That article stated that:

"In this experiment the daughters of 200-egg hens were not such high egg producers as pullets whose mothers' egg records fell in the 150-200 egg class. The daughters of the '200-egg' hens were most inferior (proportionately) to the "unregistered" pullets in respect to winter egg production."

We believe the same fact has been observed with reference to the daughters of phenomenal milk and butter producers. Some breeders have too quickly jumped to conclusions and maintain that this proves that there is nothing in heredity, and have added with reference to poultry that the barnyard scrub is just as likely to produce a large egg producer as is the carefully bred bird. It is very probable that this belief is limited, for practically all intelligent observers maintain that, as a rule, a carefully selected, well bred animal has long odds in its favor over the accidental producer. To be sure, there have been race horses and large producers in various lines of animal breeding which have come from unknown parents. This is, and always will be, a feature of animal breeding never fully explained.

It is easily understood, once we stop to think, that the cow which is producing immense quantities of butter fat and is crowded to the last limit of her physical endurance in doing so, has little vitality to give to her offspring. The same is doubtless true with poultry, and when the "200 egg hen" gives so much of her vitality to producing those 200 eggs, it is possibly wise to choose the eggs which are to produce the succeeding pen from other birds of the same strain which have not given up so much of their vitality to egg production. But let not our breeders for a minute consent to the idea that an entire pen of birds which have proven themselves low in egg production, will give a high percentage of exceptionally high egg producers.

## LEASING TO THE JAPS.

The Cultivator representative in the Newcastle section says that some three years ago many orchardists there leased their lands to Japanese contractors who have farmed them to the limit during the life of their contracts and have now turned them back to their original owners. The contracts at the time of making looked good to the owners, but when the contracts are terminated and the owner again takes possession, he finds the soil exhausted and producing capacity at so low an ebb that another period of three years may be required to put it back to where it was at the time he surrendered possession. The same has been found true in other sections where the Japanese have been encouraged to come in to lease land. It must be admitted that with labor conditions as they are, such contracts as the Japs are willing to make look very attractive to the owners, but they should look farther ahead and keep control of their own property. It is poor business policy to surrender possession of valuable property for a period of years without thorough knowledge of the methods which will be followed by the lessee.

## MR. NEFF CONTINUES INSTITUTE WORK

Farmers' Institute work of Southern California will be under the direction of Mr. J. B. Neff of Anaheim who has had to do with this work for the past three years. He is now arranging for institutes which may be held in the near future, and farmers of the southern part of the state who may be interested in having institutes held should get in touch with him.

## ALFALFA METHODS.

(Continued from Page 27.)

2. After the first crop, I irrigate twice for each cutting, building levees just high enough to hold water over land well.

3. I always prepare the land in good shape before seeding but have never inoculated seed or land.

4. I have always seeded in spring, sowing broadcast. I sow the seed as I buy it and sow about twenty pounds of seed per acre.

5. This season I cultivated my field with a disk that is built for that particular purpose and sowed about thirty pounds per acre. I had a fine crop cut off it. For several years I have sown about four hundred pounds of gypsum per acre. The use of it shows good results, but I have heard that its continued use would impoverish the land.

6. I don't have much foxtail in my field.

7. I usually cut four crops but last year had five.

8. Sell a good portion of my crop and only pasture late in the fall before the rains, but don't let stock run on it when the land is wet.

10. I leave land in alfalfa for several years.

11. Think an orchard a poor place to grow alfalfa.

12. In curing alfalfa I have to be governed by the weather, but the idea is to not let it get too dry, but let it cure in shocks. Have never used caps.

**J. C. Westfall, Sycamore, Colusa County.**

1. I grow the common variety of alfalfa. Have not tried Turkestan or Arabian.

2. I irrigate, building banks or levees twelve inches and let water stand from one to six inches.

3. I plow twice, giving the first plowing, as soon as rain has started vegetation, and the second as soon as danger of hard frost is over, which is about the 20th of February here. I harrow land down until it is firm. Do not inoculate seed or ground.

4. I sow from the 20th of February until the first of May. Have tried from twenty pounds of seed up to forty pounds per acre. I find twenty pounds per acre plenty. I clean my seed the very best that I can and exclude everything and sow broadcast. Do not plant nurse crop.

5. I do not disk, but think it a good idea on old clover. Have never used any fertilizer.

6. I get foxtail on old clover. If the weather is favorable for haying, I cut first crop, as soon as first foxtail heads appear, so that it does not damage the hay. If the weather is unfavorable at this time, we stack it and feed it on ground to outside stock.

7. We make five and six cuttings a year.

8. We sell some hay and feed some on the place. Sometimes in the dry part of the season, we pasture stock. Have had some trouble with bloat.

9. We are bothered with gophers and foxtail. Run the gophers out by irrigation and kill with shovels. Handle the foxtail as above stated.

10. Leave field in alfalfa as long as can hold a good stand.

11. We have not grown alfalfa in orchards. I think it would be all right where there is plenty of moisture.

12. When first blossom appears we cut for cow feed; a little later for horse feed. Rake as soon after mowing as rake will gather it well, then put in small cocks and let it cure in the cock. That saves the leaves. Have never used any covers for cocks in the fields.

The proper length of time from one crop to the next is about five weeks. Plenty of moisture at seed time insures a good stand. Sandy soil which drys out quickly should be harrowed thoroughly after sowing. Run a clod masher or slicker over it to finish with. I don't use any summer irrigation. Don't need it. I irrigate in the winter when the river is high, for the purpose of exterminating the gophers. Our last two cuttings would be benefited by irrigation but have no way of doing it when river is low except by pumping.

**Mrs. M. E. Sherman, Fresno.**

1. I have one acre of Turkestan alfalfa and four forms of Arabian planted this spring, but as the spring has been most unfavorable for new planting I cannot form an intelligent idea of the value of these forms from this season's work.

2. I prefer to level the land carefully so that no checks need be over two feet high, making them broad and sowing alfalfa on them, then running the water over the land slowly and not allowing it to stand to any depth for more than a couple of hours.

3. We plow deep early in the season, leaving the ground rough to catch all the rainfall. Two

(Continued on Page 40.)

# Agricultural Notes of the Pacific Coast

## Northern California

The cherry crop is practically all shipped.

Meridian, Sutter county, reports immense yield of grain.

Meridian, Sutter county, distributes $1500 a month to dairymen for cream.

Yolo county finds its hay crop better than it was anticipated a few weeks ago.

Canners at Biggs, Butte county, are offering $15 for free stones and $20 for Phillips clings.

Red Bluff prune growers sulphured prune trees extensively to prevent attacks of red spider.

Sacramento will ship 10,000 bottles of wine for free distribution in Los Angeles during the Elks' Convention.

The state road from Placerville to Lake Tahoe is being put in better shape this year than it has been formerly.

While the output of fruit will not be so large this year as last, it appears now that the returns for it will be more satisfactory.

A corporation has been formed under the name of the Standard Cheese Company which will do business with cheese in San Francisco.

A new ditch company has been organized at Greenview, Siskiyou county, to convey water to lands which have heretofore been dry.

Vacaville shipped 67 cars of green deciduous fruits in one week recently. This is lower, however, than the shipments for same date last year.

Farmers near the Alameda Sugar Company's factory were planting beets up to one week ago, which it is expected to harvest yet this season.

Marysville and surrounding towns will ship large quantities of fruit and other products of that section for distribution to the Elks in Los Angeles.

Los Angeles capitalists are investigating conditions near Oroville with the intention of establishing a sugar factory there if proper inducements are offered.

Investigations by United States engineers and levee commission find that the channels of the Feather and Sacramento rivers have been scoured and are in much better condition than usual.

Mayor White of Sacramento has issued a call for a convention to be held in Sacramento July 21st for the purpose of discussing dredge mining and its effect upon the rivers and upon agriculture.

An effort will be made by the authorities of Contra Costa county, who may also be joined by federal and state authorities, to wipe out a large number of ground squirrels which are said to be infested with bubonic plague.

The following prices were paid by the creameries of Humboldt county to their patrons for the thirty days preceding June 15th: Grizzly Bluff Creamery, 28 cents; Pioneer Creamery, 28; Capital Creamery, 28; Central Creamery Company, 29½.

Inspector Severin who has had oversight of the inspection of the butter being received by the government from Humboldt County creameries reports that he never saw a more uniformly high-grade of butter than that put out by the creameries.

## Central California

Some cars of Santa Clara cherries have sold for as high as $3000.

Arizona thistles are proving perplexing to farmers at Porterville.

About a hundred tons of raisins are being packed at the Madera packing house.

A seedless watermelon is one of the products grown by a Porterville farmer.

The Pajaronian predicts the banner year for Pajaro Valley apple growers.

The spraying for the first generation of codling motn is over in Pajaro Valley.

A fine flow of water has been struck in a well recently sunk at Terra Bella, Tulare county.

Some Hanford apricot growers have disposed of their dried crop at eight and one-fourth cents.

Some exceptionally fine tomatoes are being grown in the foothill section of Tulare country.

A young boy of Hollister county recently ate cherries and drank milk and died within an hour.

The recent warm weather has caused great increase in the flow of the rivers, but the rise has not been so great as anticipated.

Madera reports the thorough cleaning up of the white or cottony cushion scale by colonies of vedalia which were distributed in that section.

Hanford vineyardists are considering the advisability of establishing a grape juice factory. A plant with a $25,000 equipment is contemplated.

The Pacific Evaporating Co. at Watsonville will dry apples this season using oil fuel. This will be a new departure in fuel for fruit evaporation.

The district forester has made a thorough inspection of the Monterey forest and finds splendid trails which have been made to better control forest fires.

Some peach orchards in Fresno county are showing a falling of the fruit which will materially reduce the crop. Splitting of pits is also a serious trouble this year.

The farmers near Salinas who guaranteed the liquor accounts of Japanese laborers were let off easy by the internal revenue officers as to their fines, owing to its being their first offense.

Raisins have been commanding a much more satisfactory price for the past few weeks, and many growers are of the opinion that the opening price for the new crop will not be less than three cents in the sweat box.

At the recent annual meeting of the Porterville citrus association, the following named gentlemen were elected directors: F. D. Bailey, E. O. Giddings, H. C. Carr, Peter von Ting, W. L. Loss A. Chalmers and A. Milligan.

At the recent annual of the Zante citrus association, Tulare county, the following directors were elected: V. D. Knupp, Wm. Duncan, E. E. Graham, W. L. Hemphill, C. N. Flanders, G. L. Robbins, J. F. Canty. Henry Grant, in view of his efficient service in the work of the association was chosen for the manager of the packing house for the coming year.

## Southern California

Apricot dryers are busy people at San Jacinto.

The flood of the Colorado is now ebbing rapidly.

The grain harvest in the Imperial Valley is closed.

A stack of 115 tons of hay recently burned at Imperial.

The La Habra farmers' club held an interesting meeting last week.

The cherries in the Yucaipe Valley, San Bernardino County, have been of exceptionally good quality this year.

Land owners at Saticoy, Ventura county, will greatly extend the irrigated area of this region.

The farmers at Mound, Ventura county, recently held their annual picnic, over 60 members being present.

A little slice of the eastern warm weather seems to have been given to Southern California in the last few days.

The Covina farmers' club recently held its annual picnic at Walnut Creek, having an exceptionally good picnic dinner.

Anaheim potato growers have found this a most successful season and have shipped large quantities of a fine product.

The Southern California Dairy Association consisting of 450 dairymen and farmers about Los Angeles has been organized.

Santa Ana ranchers have found coyotes so plentiful that several young ones have been run down and captured by farm hands.

Owing to good prices at Prado, Riverside county, hay producers are selling as fast as hay is baled and none has yet gone into storage.

Plans are being drawn for a packing house to be built at Highland, San Bernardino county. It is proposed to make it large enough to handle lemons from 150 acres.

The Los Alamitos sugar beet fields are looking exceptionally well, and a bumper crop is assured. The work of cultivation is practically over except the final hoeing.

A walnut growers association at Orange is advertising for bids for the erection of a new packing house. The building will be 50 by 108 feet and will have sixteen bins.

State veterinarian, Chas. Keane advises the abolition of public watering troughs in order to control the disease of glanders which has spread more or less over the state.

J. W. George, President of the Imperial Valley Beekeepers Association, thinks that a price of five cents a pound for honey, or a little better, can be maintained through the season.

The grain crop of Riverside county is estimated by the Riverside Press to be worth over two million dollars, or as the Press says, the most valuable crop in Riverside county. It will require over sixteen cars to ship it.

The vegetable gardens of Orange county have been in part taken up by Japanese farmers. Especially is this true in the celery fields, but instead of competing with white celery growers, the Japs have joined the cooperative association, and two Japs have been admitted as members of the board of directors.

## The Coast

The water in the lake at Roosevelt dam, Arizona, is 110 feet deep.

Colorado will hold a national apple exposition December 6th to 12th.

Floods in Colorado earlier in the month did great damage to farm crops.

Walla Walla county, Washington, will produce 5,000,000 bushels of wheat this year.

Denver milk men raised their price on milk on July 1st thirty-three and a third percent.

The fourth Dry Farming Congress will be held at Billings, Mont., October 26th to 28th.

The gate receipts show that over a half million people have already visited the A-Y-P Exposition.

The sugar factory at Glendale, Arizona, is now turning out 2000 sacks of sugar every twenty-four hours.

The labor troubles between the planters and the Japanese of the Hawaiian Islands, have largely subsided.

A hop grower at Independence, Oregon, has sold his this year crop of hops at fourteen and three-fourth cents.

Multnomah county, Oregon, bought its poor farm some years ago for $20 per acre and sold it recently for $765 per acre.

The big Laguna dam between California and Arizona stood the test of the recent floods without showing the slightest strain.

The Interstate Fair to be held at Spokane is offering cash prizes to the school boys of the state for the best ten ears of corn.

A farmer at Grand Junction, Colorado, has developed a wheat which he maintains will yield on an average 80 bushels an acre.

The flood of the Colorado River has passed the crest, reaching nearly thirty feet. It did no great damage to farming lands of Arizona.

Owing to heavy rains the reservoirs constructed for irrigation in the Hawaiian Islands have been filled with water as never before.

The state college demonstration train made an extended trip during the closing days of June through all of Northwestern Washington.

The three reservations to be thrown open to public entry in Idaho, Montana, and Eastern Washington aggregate 70,000 acres of land.

The dam which holds the water in the Antero reservoir in Colorado is over a mile long and controls the water for irrigating 55,000 acres of land.

Twenty-five men formed in line in the land office at Lewiston, Idaho, on June 22nd, and propose to hold their position until the time of filing on August 2nd.

A farm at Culver, Washington, which in the past had yielded only nominal returns, yielded the past year under dry farming methods $3,396 above all expenses.

The National Public Domain League held a meeting in Denver July 1st to protest against the method of the national government in setting aside so much land in forest reservations.

**FOR MOULTING HENS**

Feed

**MIDLAND**

**Poultry Food No. 4**

**$1.95 per Sack**

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.

# Profit in the Poultry Yard

By Mrs. Frank Metcalf

**We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.**

## A MODEL PLANT.

A COMPANY has been formed to build up the largest broiler plant in the United States, at Inglewood, Los Angeles county.

The Company is incorporated at $100,000, and owns 40 acres of fine land southwest of Inglewood, upon which it is now erecting the finest and most improved type of poultry houses. The breeding house proper is 580 feet long, the brooder house about the same length, and the Adminstration building, incubator cellar, to hold 1,500 eggs, and dwelling are put up after plans originated by the manager, D. H. Hammons, and are unique.

Mr. Hammons has found that there is money in raising the best of milk-fed, crate fattened broilers for the Los Angeles hotel trade, and has raised some thousand yearly on the magnificent ranch owned by the same management in Highland.

He believes the cool breezes at Inglewood will allow of raising chickens the whole year,

Mr. Hammons has demonstrated that more fowls can be kept on less land than many persons believe. He never lets his birds out-doors. His houses are two story and the earth beneath each house is removed to a depth of 15 inches and the space filled with clear, sharp sand, analyzed and known to contain certain minerals, and the character of the soil originally makes little difference, although this plant is on sandy soil.

By this style of house, using his method of feeding, a method which he has reduced to an exact science, he finds it possible to keep 10,000 laying hens on an acre of ground, and keep them in perfect health and laying all the year around. Not that he expects every hen to lay an egg every day, but he does expect each hen to produce an egg every other day during her first year's laying, beginning at six months old, sometimes less.

He calls his breeding house; "The Economy" and says the cost of the building is 62½ cents per laying hen, or $1.00 per breeder, as he only keeps 10 breeders in each house, but 16 layers may be profitably kept in each one.

As his houses take up a space of ground of but five feet by eight, on the ground he figures that the cost of the land per hen, with land at $250 per acre is but two and one-half cents per hen.

The labor of caring for the birds in this house has been minimized to a fraction of the time usually necessary on large plants. When this plant is in operation, it will doubtless be widely copied, as Mr. Hammons is willing that anyone should do so, providing they will take the trouble to come and examine the details, for themselves.

To prove the efficiency of this house I will append the record of 16 pullets kept in one, never having been outdoors in their lives.

Out of a hatch of 26 White Rock chicks, May 14th, 1908, 25 were raised in a fireless brooder, were weaned from the brooder at eight weeks, and the 16 pullets were placed in an open front Hammons Economy house.

A Petaluma Poultry Yard.

Floor space five feet by ten, sand floor, house fronting south. November 1st a record of eggs was begun. From November 1st to May 1st these pullets never laid less than eight eggs any one day, and have laid as many as 14 eggs in a single day. The general average for the entire seven months was 12 eggs per day from these 16 pullets.

The average feed cost per dozen eggs was six cents, green food not counted. These birds are still confined in this house at the present writing, and are still doing well. This house allows but three and two-thirds feet of space to each bird.

The feed consisted of grains and green food once a day and a hopper of dry mash, composed of beef scraps and grains, oyster shell and charcoal, with fresh water before them at all times. The grain being fed in a litter of about of about six inches of cut straw, compelling exercise.

The house was sprayed twice a month with a three per cent solution of creolin. Only two have gone broody and their general health has been of

the best, exploding the theory of large runs or free range being at all necessary for best results from poultry.—Mrs. Frank Metcalf.

## POULTRY QUERIES.

### Plymouth Rock Eggs.

Can you give me any information on how to hatch Plymouth Rocks in an incubator? Do they require more heat and moisture, and if so, how much? If you will answer this you will confer a favor on yours truly,—C. A. R., Gridley.

Plymouth Rock eggs do not require any more moisture or a higher degree of heat than any other eggs, although it is claimed that Leghorn eggs will hatch at one degree less than will the eggs from any of the larger breeds. This we have never proved by experiment, so take it with a "grain of salt." As to moisture, be sure to procure one of the new Hygrometers, if your machine is not already provided with it.—Mrs. Frank Metcalf.

### Blood Meal.

I would like to know through the columns of your valuable paper if blood meal takes the place of beef scraps in a balanced ration for hens or if it is necessary to feed both. Would beef scraps keep in a warm climate like Arizona. We cannot obtain it here.—Subscriber, Douglas, Arizona.

Blood meal cannot take the place of beef-scraps in the ration, and can be dispensed with to better advantage than can the beef scraps. I do not use the blood meal at present, but do use fresh green cut bone twice a week in addition to a liberal allowance of the beef scrap in the mash. As hens begin to moult the protein can be increased gradually.

Beef scrap should keep perfectly in Arizona, as it is dry there, and your best way is to have a full 100 weight sent from the dealers in poultry supplies at your nearest city.

The granulated milk is another good food rich in protein, much relished by the hens. It can be substituted for the blood meal with good results, for the hens do not usually relish the blood meal for some reason.—Mrs. Metcalf.

## SULPHURING POULTRY HOUSES.

M. E. Miller and Sons. valued subscribers of the Cultivator, located at Paramont Ranch, Ritchey, Amador County, write us giving the following useful points as to the use of dry sulphur in chicken culture. They say, "Dry sulphur sprinkled around the coops, especially along the roofs and in cracks, will prevent chicken mites. We sprinkle our coops with sulphur about every two weeks, and there is not a mite to be found either on the coops or on the chickens. In making nests, we put in ashes and then straw and sprinkle with a little sulphur on top. In fact, we find sulphur invaluable in the chicken business."

In handling geese they should always be taken by the neck, and when lifted from the ground the body should be turned with the back toward the person handling it. In that position it cannot strike, and will remain quiet and docile. The body can be partly supported by seizing the first joint of the wing with one hand. If the goose is held facing one, it will strike hard blows with its wings, or scratch with its feet.

Nest boxes should never be permanently attached to the building or to each other. Each one should be separate and easily movable, and in this way they may be frequently removed to the outside of the building and scalded with boiling water, painted with lice killer and thoroughly renovated in this or any other way that will accomplish the desired end.

Now is the time of year that the ever present question pervading the family council is, "Where shall we go, or what shall we do this summer?" The planning and scheming period is now upon us when our thoughts turn from the sordid pursuits of city life; for man hath need of rest and he longs for the simple joys the country yields. We all wish to set aside for awhile the cares and worries of business and visit the Blessed Isles of rest and recreation.

To aid you in selecting a place for your outing or to locate your family for the summer so as to make possible week end trips, the Northwestern Pacific Railroad, the Picturesque Route of California, has issued a book called "Vacation." This book describes the garden spots and playgrounds of California in the counties of Marin, Sonoma, Mendocino, Lake and Humboldt. You can find in this book some place to suit your fancy and your purse, whether it is to fish, hunt, swim, rusticate on a farm, or visit the numerous mineral springs or resorts.

The issue of "Vacation 1909" is now ready for distribution and can be obtained from the Northwestern Pacific Railroad at the Ferry Ticket Office, the Up-town Office 874 Market St. and Room 986 (General Office) Flood Building, San Francisco, Cal.

**No Flies at MILKING TIME!**

Don't blame the cow for switching her tail so furiously. Don't throw the milk-stool at her because she "side-steps" and upsets milk pail. The critter can't help it when flies are constantly prodding her hide for warm red blood.

**Conkey's Fly Knocker Knocks Flies**

Spray your cows with Conkey's Fly knocker and the flies won't come near. It drives them away. The greatest discovery of the age. Sold under a positive guarantee. Prices—qt. 35c; ½ gal. 60c; gal. $1. Agents wanted everywhere. Write today.

**Coulson's EGG FOOD**

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

For sale by dealers everywhere. Write for our free book "Poultry Feeding for Profit" with samples of our Poultry Food.

## POSTAL SAVINGS BANKS AND VESTED INTEREST.

BY courtesy of the State Bankers Convention I listened this morning to Lovell White's opinions as to the proposed installation in the United States of Postal Savings Banks. By the applause which followed the reading of his paper his views obviously were adopted by the Convention, which also passed a motion for printing the document and circulating it widely. I assume, therefore, I am justified in believing not only that Mr. White voiced the sentiments of vested interest in the matter, but also that his argument comprised about all that can be said in opposition to the institution of Postal Savings Banks.

If so, this opposition must be sadly lacking in logical foundation. Far too many words were devoted to the when-your-case-is-bad-abuse-the other-side style of arguing. There was too obvious an endeavor to belittle the advocates of such banks by toploftically relegating them to the ranks of "half-baked" theorists.

This reproach, of course, in face of the hard facts as to Postal Savings Banks, proven by many years European experience, might far more justly be flung at those who would oppose their half-baked theories to the institution of such well accredited utilities. Britain for example, with $750,000,000.00 deposited in such banks, has enormously increased her non-governmental banking facilities.

Nearly all this ammunition was of the same recoiling kind. For example, he stated that one of the chief classes intended to be benefitted by these banks was the class of foreign immigrants. These, however, would not, he said, make use of them because they were so distrustful of government institutions in their native land. He entirely overlooked the fact that many of them come here for the explicit reason that they have faith in the American government, and even belied his half-baked theory, notably by investing during the late panic in Post Office orders, seeing there were no Postal Banks.

He denied that these Banks would be useful in outlying country districts because the pioneer never had a cent to spare to deposit in any bank. This in the face of the millions—I had almost said billions—of dollars annually wrested from the soil by lumbermen, miners and ranchmen living dozens of miles from either Savings Bank or Express office. He deplored the terrible need of enlarged house room and increased clerical staff that would follow so vast an addition to the Nation's business. This was as pathetic as the appeal of the British lord in the House of Commons who antagonised Rowland Hill's penny postage scheme because it would induce such a deluge of letters as should "burst open the walls of the Post Offices." Probably when Mr. White's business warrants larger buildings and a more numerous staff, he hardly deems it an occasion for wailing Jeremiads of coming failure, and mourning and woe.

"We ought," Mr. White further considered, "to be satisfied with present arrangements because failures were infrequent and losses infinitesimal." Mr. White probably has figures to substantiate this statement, but I imagine it will prove but cold comfort to the many who lost the major portion of their life's earnings in some 1907-panic-stricken bank.

Another bugaboo shaken to scare the sorely beguiled advocates of Postal Savings Banks was that their advent would destroy the equilibrium of investment, half in mortgages and half in readily convertible securities, at present customary in Savings Banks, because in panics, he averred, people would withdraw their deposits from ordinary Savings Banks to place them in Postal Banks. He omitted to say how much better this would be than hiding those same amounts in old stockings or safe deposit vaults. He omitted to say that moneys so handed to government could be at once restored to circulation and be the very best means of checking further panics.

These are fair examples, as cogent as any, of Mr. White's arguments. He further indicted the advocates of Postal Savings Banks, who by the way, he admitted were the majority of the people, as aiders and abetters of "Fraternalism" or "Paternalism."

An Alfalfa Plant.

At risk of being classed as an "awful example" of either, I yet venture to subscribe myself as, Mr. Editor.—Edward Berrick, President Postal Progress League of California, Pacific Grove, May 28.

## USE OF CHEMICALS ON STUMPS.

The chemical destruction of tree stumps has been rather freely discussed in trade journals from time to time, but there seems to be no definite information available concerning the efficiency of the various methods. Unfortunately the Forest Service has made no tests along this line and it is therefore unable to make a definite statement at the present time. There seem to be three favorite methods of destroying stumps by means of chemicals. In all of these methods several large holes are bored into the stump and are plugged up with paraffine-coated plugs, after having been filled with the chemical. In the first method, concentrated sulphuric acid is used; this is supposed to rot the stump out within from three weeks to six months. In the second method a mixture of concentrated sulphuric acid and concentrated nitric acid is used; this method is supposed to be somewhat more efficient than the first one. In the third method, the holes are filled with saltpeter which is allowed to [illegible] in them for about six [illegible] the end of that time the [illegible] moved and the stump is [illegible] with kerosene and ignited. Th[illegible] is supposed to be entirely cons[illegible]

## ALFALFA METHODS.

(Continued from Page 36.)

weeks before planting time we [illegible] four inches deep, harrow and cr[illegible] harrow until the ground is fine [illegible] smooth. We always inoculate seed [illegible] around. Prefer, however, to stir [illegible] seed into a mud made from soil fr[illegible] good alfalfa field. This requires le[illegible] labor and has been as successful with us as sowing the earth from an alfalfa field. The bottle cultures have not given us any great success.

4. March has been our most s[illegible] cessful month for seeding on good a[illegible] well cultivated soils. Twice we ha[illegible] sown in August; once with good su[illegible] cess; the other time it was nearly as bad a miss as this season. We broadcast with the little hand seed sower and then brush in with a brush harrow. Always examine the see[illegible] carefully and buy only that which is reasonably clean, screen it and then spend a few hours in picking it ove[illegible] by hand. We spread the seeds on a table covered with oil cloth, with th[illegible] legs on one side raised a couple [illegible] inches, pour out the seed and push [illegible] along, letting it drop off the end into a box put on a chair. The bad seed push off at the side away from the sorter and fall to the floor to be gathered up with the dust pan and burned. If the land is disposed to grow sunflower and bronco grass, a nurse crop of barley seeded on the ground before the alfalfa is brushed in, will help hold them down until the alfalfa gets a chance to grow strong enough to hold its own.

5. Disk after the second year, every winter, going both ways and re-seeding thin spots with barley and alfalfa mixed. (b) Have fertilized with gypsum, barn yard manure and bone meal, greatly increasing the crops.

6. If the land is well disked in the fall and re-seeded to barley and alfalfa there will be little foxtail to contend with. If there is much we make it into silage.

7. We make six or seven cuttings a year.

8. Feed at home. Do not often allow stock to pasture as it is wasteful. Have no trouble with bloat if cows are watched when first turned on the alfalfa and kept out only a few hours a day at first until they have grown accustomed to it as a feed.

9. Dodder is cut and burned on the infested spot as soon as it appears.

10. Alfalfa grows well for ten to fifteen years with us and is then turned under and the land cropped to grain, hay or corn, or planted to orchard or vineyard.

11. Have observed long strips of alfalfa in orchards and believe it is a good way to fertilize old trees if sufficient room is left for proper cultivation around the trees, but have never grown it in orchard.

12. We harvest when the first glimpse of color can be discovered. Would rather be too early than too late. A day after mowing in the very early spring we rake. Later it may be raked within a couple of hours after cutting. The less alfalfa is handled the better. Nature is too kind in California to make us put night caps on the hay cocks.—M. E. Sherman.

When writing advertisers, mention Cultivator.

R. W. Clothier, Agricultural Experiment Station, Tucson, Arizona.

1. The common variety of alfalfa is grown exclusively in Arizona. Trials of Turkestan and Arabian varieties give promise of improvement, though we have not yet engaged extensively in experiments with them.

2. We irrigate. We irrigate chiefly in lands and the borders after settling are perhaps not over six inches above the level of land. Where land is level four to six inches of water is considered sufficient for one irrigation. Where sloping, the water is run over the land till it reaches the farther end.

3. The land is prepared for seeding by plowing six or eight inches deep and then pulverizing by any implements available till it is in thorough tilth. The disk harrow is largely used, also a drag made of lumber. Inoculation of seed or ground has not, to my knowledge, been practiced in Arizona.

4. Planting is most successful when done from September 20 to November 10 and in January and February. Twenty pounds seed per acre is considered the proper amount to sow. Most of it is broad-casted, but I have no doubt that careful use of the press-drill would give better results. Seed is made as clean as possible before planting. Best results are obtained without nurse crop.

5. Some farmers practice disking and many do not. The spring tooth harrow is used instead of the disk on adobe land, and still better is the spike tooth disk. Those who practice disking, disk only once per year. Lime and fertilizer have not been used to any extent in Arizona.

6. The first cutting is more or less mixed with mallow or foxtail, depending upon the individual and also the amount of pasturing it has had the previous winter. The silo is not used in Arizona. Weedy hay is sold for what it will bring or fed on the place.

7. Five to seven cuttings in the Gila Valley and Salt River Valley. Eight to ten at Yuma.

8. Hay may be sold or fed on place, depending upon the inclination of the individual. The prevailing practice is to sell. Stock are pastured any time of the year if field is not wanted for a hay crop. The hay fields are pastured in winter and many steers fattened for market in this manner, being brought in from the range. There is always danger from bloat. Stock men have told me the risk of loss from bloat is at least ten per cent. I believe this over-estimates the actual loss.

9. Our chief enemy to alfalfa is the root rot which we have not yet learned to handle. Disking frequently is recommended till more can be learned about the subject.

10. Alfalfa is allowed to occupy the field as long as it will stand any kind and amount of abuse and still produce profitable crops.

11. The growth of trees in alfalfa is not so rapid as in fallow ground. They fruit earlier but would not produce so great a yield. The practice is not a common one.

12. Alfalfa is cut when about ten per cent of the plants are in bloom, or when ten per cent of the blooms are out. Hay cut in the morning may be raked and cocked in the afternoon and baled or stacked the next day. Caps are not used for cocks.

Arthur Fell, El Centro.

I have had five years experience in growing alfalfa in the Imperial Valley. I began it because I had heard that alfalfa was the "king of crops and a mortgage lifter." It was my desire to get the king by the hand and in that way hold to the mortgage lifter. After securing my land and choosing that which I found most suitable for alfalfa I began leveling and bordering the land, being careful to make the borders not too large. I do not like too much dry dirt, for it makes harbors for red ants, field rats and squirrels, which become a great pest and live on the alfalfa while growing.

After the first irrigation settled the low land, and showed how badly we had levelled, we levelled again by working on the inside of the borders, which is a quicker and therefore cheaper way of putting it in satisfactory shape. After this re-levelling, we irrigated again, not only the second time but the third, before we got the levelling entirely satisfactory.

I sowed my first seed on September 10th. All seed started well, but some kept dying all through the fall. The next planting was made October 5th to 10th, this time sowing one-half the seed on top of the ground and harrowing in, and disking and harrowing the other half. Following this, of course, we irrigated most thoroughly; both sowings in this case doing equally well in starting though the half that was harrowed in kept dying for some time after it came up. I sowed again on October 25th, disking in the seed and putting it in very deep. It took the seed a long time to come up and it grew very slowly. On the 15th of December I sowed another field two borders wide which came up nicely. It was harrowed in and grew fully as well as that planted October 25th. Other sowings were made on January 20th and February 15th. The ground was treated about the same way, but the plants died out or drowned out in irrigating. The March sowing was also drowned out or dried out by the April and May winds. These sowings covered about sixty acres.

The second year we began by carefully plowing the land. The ground was much harder than that planted the first year. Seed was sown each month as in the previous year, but in each plowing of the soil the ground soaked up more water and kept the alfalfa growing longer without any more irrigation, which is a great advantage to young alfalfa. That is the reason the fall sowing did better and gives larger growth. Seed sown in February or March or later has to be watered more, which destroys the young plants (at least when they have only three leaves) as this is the critical period in the life of the young plants. Alfalfa should not be watered until it has the fourth leaf. The plants at this time have strength enough to break through the mud and dirt which may settle upon them.

Our experience in sowing is that it is best to sow on soft ground in October or November by disking and harrowing in the seed, later sowing by harrowing in. Plowing is certainly an advantage on the harder soil. In order to get a good stand or growth, one should be careful to have ground well irrigated before seed comes up, not watering after sowing until the fourth leaf appears.

**Water Pipe**

**Standard Black Pipe**

Prices as follows, standard pipe:

| New Per Foot | | Second-Hand Per Foot | |
|---|---|---|---|
| ¾ in. | 2.90 cts. | ¾ in. | 1 ct. |
| ½ in. | 2.90 cts. | ½ in. | 1 ct. |
| ¾ in. | 3¼ cts. | ¾ in. | 1½ cts. |
| 1 in. | 4¾ cts. | 1 in. | 3 cts. |
| 1¼ in. | 6½ cts. | 1¼ in. | 4 cts. |

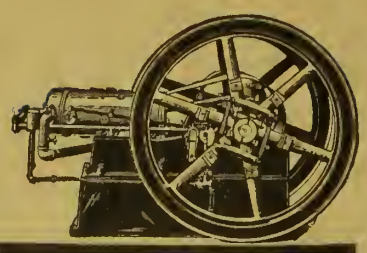
# A RELIABLE WATER SUPPLY FOR IRRIGATION



AFTER preparing the ground, sowing the seed and getting the crop well started, your greatest concern is for a reliable water supply. You *must* have water to irrigate in season. Your crop may be ruined in a single day for the want of it.

You have a dependable supply of water in the form of low lying lakes, ponds and reservoirs. The problem is to raise this water so you can apply it to the land.

Do you know that you can raise such water and make it available for irrigating all your lands by means of the powerful I.H.C. gasoline engines?

They will not only pump water for you in large quantities, but they do it economically. It costs practically nothing to keep an I. H. C. engine in repairs, and the expense of operating it is a very small item compared to the value of the crops you can raise.

An I. H. C. engine as the basis of your irrigating plant makes you master of the situation. You are independent of the ditch and ditch officers. You have a water supply that is all your own. You can start your engine any time and apply water to your land whenever the crops require it.

Keep an I. H. C. engine supplied with gasoline and it runs dependably, hour after hour, requiring but very little attention. You need return to the engine only occasionally, so you are free to spend practically all your time handling the water in the field.

One of the advantages in purchasing an I. H. C. engine is that the engine can be used for many other purposes besides pumping. It is a general all-round farm engine—an absolutely reliable source of cheap power for operating the grindstone, churn, fanning mill, feed grinder, separator, bone cutter, washing machine, etc. I. H. C. engines are made in many styles and sizes, so that you will be able to find just the engine you want. There are

**I. H. C. Vertical Engines**—made in 2, 3 and 25-horse-power.
**Horizontal (portable and stationary)**—in 4, 6, 8, 10, 12, 15 and 20-horse-power.
**Gasoline Tractors**—in 12, 15 and 20-horse-power.
**Famous Air-Cooled Engines**—in 1 and 2-horse-power.
**Spraying and Sawing Outfits** in various styles and sizes.

Call on the International local agent handling I. H. C. engines. He will supply you with catalogs and full particulars. Or, if you prefer, write to nearest branch house.

# Queries and Replies

**Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### Leaf-eating Beetles.

I enclose specimens of bugs which are eating leaves of fruit trees. They seem to go in the ground in daytime and come out at night. The ground about the trees is full of them. What are they? Will they kill the trees? What shall I do to get rid of them?—W. W. J., Buena Park.

The beetles are without doubt Serica fimbriata, and as stated are night leaf-eating beetles. They go into the ground in the daytime as they cannot stand heat. The remedy is to spray with arsenate of lead at the rate of three pounds to one hundred gallons of water, or you can shake them from the trees at night into something framed like an inverted umbrella and empty them into water with a little kerosene on top.—S. A. Pease, San Bernardino.

### Fertilizers.

Is gypsum anything more than a stimulant to plants, that is, to make the plant food already in the ground available? If it is only a stimulant, isn't there danger of ruining land by its continual use?

Is there any danger from use of phosphoric acid and potash? There is a good deal of both used here on the alfalfa fields.—D. F. C., Modesto.

We do not think gypsum could be called a stimulant in any sense. It does, however, make the inert plant food of the soil available and if continued many years does for that reason reduce in time the producing capacity of the soil. It is not a fertilizer but does have a beneficial effect on the soil and is used often with great profit.

Of course it might be possible to add phosphoric acid and potash in sufficient quantities to injure crops, but with so expensive materials it is hardy probable. They are both plant foods, and used properly can only benefit the soil.

### Squirrel Exterminator.

To get rid of squirrels our ditch tender uses pieces of sacks, about two by four inches, dipped into melted sulphur that has sheep dip added to it. These he dries and sets on fire in the holes, being careful not to cover the sulphur with dirt when filling hole. I have read the Cultivator a great many years and always look to it as an authority.—D. F. Conant, Modesto.

### Free Poisoned Wheat.

A Los Angeles subscriber has asked if the state distributes free poisoned wheat to be used in the destruction of ground squirrels. We have never heard of any such distribution, and in reply to our letter to the State Agricultural Society, the Secretary informs us that he thinks the State University publishes a formula for poisoned wheat, but knows of no provision for its distribution.

### Berry Questions.

"Kindly name the difference in days in time of ripening of the following dewberries: Gardena, Austin, Premo, Lucretia, also name the bearing qualities of each, especially in the interior valleys."

"What is the average life of the dewberry, and what kind of a crop should one expect the second year under favorable conditions?"—"XYZ"

The Gardena and Austin are one and the same. I have grown them side by side and it was impossible to detect the slightest difference. The fact of the matter is that the Austin happened to fall into the hands of a grower who saw wonderful possibilities for it in California and renamed it Gardena and sent it out as a new variety. With me it was at least ten days earlier than the Lucretia and has the habit of maturing its crop pretty much all at once—while the Lucretia continues often several weeks before the crop is all matured. Growers differ as to the advantage or disadvantage of this feature. The Lucretia is the finest in quality and I question if any known berry of the blackberry tribe equals it. I have had no experience with the Premo, but it is highly spoken of in the East. This, however does not argue that it will do well here. Only an actual trial will demonstrate that. The dewberry plantation should last many years if properly cared for—not less than ten. But the plants must be fed and kept clean and free from disease if the best results are wanted. A full crop ought to be had the second year. —Q. A. L.

### "More Bugs."

An item entitled 'More Bugs" appeared in your last issue. As I have been experimenting successfully with the fighting of this little brown pest, will give my remedy. These bugs work on the foliage at night only, hiding in the ground near the tree during the day. You can observe their holes about the base of the tree. To dispose of them, slack lime to the consistency of ordinary whitewash, apply freely for a foot around the tree and close up to it. The bugs will work their way out during the night, and some may find their way back, but apply again, filling their holes with lime. This last dose fixes them. They will not stay around the lime.—W. G., Chino.

# Legal Queries

**Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.**
**Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.**

### Seepage From Irrigation.

Is a person liable for damages if seepage from irrigating water used on his property collects on the lower lands of neighbors and damages crops?—W. B., Escondido.

If the seepage referred to is in spite of the care of the owner of the upper land, there is no liability, but if the damage to the lower land is caused by neglect or the deliberate turning of the water upon it, then the lower owner might have damages.—E. L. P.

### Stolen Invention.

Is there any way of securing my rights when I have made an invention which was stolen before patented and later patented by the party who secured it? Is there any way of prov-

ing the theft and of placing injunction on the marketing of it by the one who really invented it?—A., Kelseyville, Lake County.

I am not a patent attorney, but understand that the one who first conceives an idea, which is afterwards patented, may, in a contest brought for that purpose, establish the fact that the idea was his, and secure the right to the patent. There is legal machinery sufficient for establishing the theft, provided you have the necessary evidence. The proper course is to consult an attorney who makes a specialty of that business.—E. L. P.

**Liability For Pastured Animals.**

I put in pasture a mare with seven or eight months colt at her side and two other colts. The mare's colt fell in an open well. The mare then disappeared, was supposed to have broken over the gate after losing her colt. Later one of the other colts died a natural death for which I could blame no one, so I only got one colt out of the pasture. What claim have I on the pasture man?—E. D. S., Pomona.

A depositary of animals for hire is required to furnish a reasonably safe place for them, and to use ordinary care to see that they are not injured, therefore, I should say that if the pasture man above referred to, was not ordinarily careful to see that his premises were in a safe condition, he is liable for the loss of the colt that fell in the well. There being no lack of care on the pasture man's part, causing the loss of the mare and other colt, no recovery can be had for their loss.—E. L. P.

**Poison Out.**

Please give me information as to the law regarding the distribution of poison. Do I have to put out any signs when I place poison on my own property to destroy squirrels or other pests? If squirrels make their holes on property adjoining mine, may I go on it to poison them, or if not, how should I proceed to protect my own property?—X., Los Angeles.

I know of no law requiring a person to put out signs when placing poison on his property.

Of course, you cannot go upon your neighbor's land without his permission, as a matter of abstract law; but I presume your neighbor would have no objection if you did no damage.

It is hardly necessary to say that one must be careful about spreading poison, as the Code provides that: "Every person who willfully administers any poison to an animal, the property of another, or maliciously exposes any poisonous substance, with the intent that the same shall be taken or swallowed by any such animal, is punishable by imprisonment in the state prison not exceeding three years, or in the county jail not exceeding one year, and a fine not exceeding five hundred dollars."—E. L. P.

**HOW IT ALL CAME ABOUT.**

A very neat and attractive booklet has just been issued by the Petaluma Incubator Co., giving the history of the manufacture of the first incubator in California and the growth of the great industry in Petaluma. The booklet was issued primarily for distribution at the A-Y-P Exposition at Seattle, and 65,000 copies were printed for this purpose It has been so attractive, however, and so much admired that the company has decided to get out a second addition of 200,000 copies. We are not informed whether these are for free distribution but doubt not that if request were made by mail to the Petaluma Incubator Co., at Petaluma, that copies would be mailed without charge. The booklet is full of portraits and other illustrations which add to its attractiveness.

# Veterinary

Answers in this column by Dr. R. T. Whittiesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

**Barbed-wire Cut.**

Can you tell me how to treat a bad barbed wire cut on the forearm of mare? I have sewed up the cut and treated with creolin and carbolic acid. The wound is healing nicely but the flies are very bothersome. Would cowease sprayed on the wound or on burlap fastened loosely around it keep them off? Would it heal the wound?—Horseman, Sonoma.

There is nothing that can be sprayed on a wound that will keep off the flies for any length of time. Keep the wound as clean as possible with plenty of water, not by washing it with a dirty rag or sponge, but using the hose until it is washed clean. Then spray on the following twice daily: Zinc sulphate and lead acetate, two ounces of each to one gallon of water. This will soon form a covering over the wound.—R. T. W.

**Thrush.**

What is the cause of thrush in the frog of horse's hoof, and how is it best treated? Does working or driving moderately aggravate the trouble? —Subscriber, Claremont.

Thrush is caused by neglect. To cure, make a solution of sulphate of copper and water and pack the cleft in the frog with oakum or cotton soaked in the above solution. Renew once daily. Give the horse his regular work.—R. T. W.

**Corns.**

My horse has had corns for the past two years. The blacksmith cuts the corns out every time he trims the feet, and when he does so the corns bleed and I am unable to use the horse for about two weeks.—A. G., Downey.

The shoer is doing wrong in trimming the hoof as you describe. If the horse were shod with rubber pads and the bottom of the wall cut away so it would not touch the pad near the seat of the corn, he would get along very much better.—R. T. W.

**Lumpy Jaw.**

My Jersey cow has had a large swelling on one side of her neck ever since she had her calf in April. It has never broken or shown any signs of running but looks more like a wind puff. Two weeks ago another swelling started on the other side. Otherwise the cow is apparently in healthy condition.—B. F. F., Silsbee.

Your cow probably has lumpy jaw. Make a solution of one pound potassium iodide in one quart of water. Give a dose of one-half ounce of the solution night and morning. This quantity will be sufficient for two months treatment and will usually effect a cure.—R. T. W.

**DR. WHITTLESEY'S VETERINARY REMEDIES.**

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

Spontaneous combustion was the cause of over a hundred tons of alfalfa burning near Porterville recently.

**DIVIDEND NOTICES OF THE ASSOCIATED SAVINGS BANKS OF SAN FRANCISCO.**

THE GERMAN SAVINGS AND LOAN SOCIETY 526 California St., Mission Branch, 2572 Mission St., near 22nd. Richmond District Branch, 432 Clement St., between 5th and 6th Avenues, San Francisco. For the half year ending June 30, 1909, a dividend has been declared at the rate of four (4) per cent per annum on all deposits, free of taxes, payable on and after Thursday, July 1, 1909. Dividends not called for are added to the deposit account and earn dividends from July 1, 1909.

GEORGE TOURNY, Secretary.

* * *

SAN FRANCISCO SAVINGS UNION, northwest corner California and Montgomery Sts. For the half year ending June 30, 1909, dividends have been declared at the rates per annum of four and one-eighth (4⅛) per cent on term deposits, and four (4) per cent on ordinary deposits, free of taxes, payable on and after Thursday, July 1, 1909. A dividend not drawn will be added to the deposit account, becomes a part thereof and earns dividend from July 1st. Money deposited on or before the 10th day of July will receive dividend from July 1st.

R. M. WELCH, Cashier.

* * *

THE SAVINGS AND LOAN SOCIETY, 101 Montgomery St., corner Sutter St., San Francisco. For the half year ending June 30, 1909, a dividend has been declared at the rate of four (4) per cent per annum on all deposits, free of taxes, payable on and after Thursday, July 1, 1909. Dividends not drawn become part of deposit accounts, and earn dividends at the same rate, from July 1. Money deposited on or before July 10 will earn interest from July 1.

WM. A. BOSTON, Cashier.

Mr. F. G. Preston, a subscriber at Cape Town, Humboldt county, reports that this is the dryest season ever known in Humboldt county. There have been only two very light rains since the 28th of March. However, the heavy fogs have been of great benefit to many crops.

The state grain inspector of Washington estimates that the wheat crop of the year will be not less than thirty-seven million bushels and possibly as high as forty million bushels. This estimate is ten million in advance of last year's production.

Early shipments of grapes from Coachella Valley have proved them to be good sellers.

**FARM LANDS FOR SALE.**

YOU CAN MAKE MONEY ON THIS fine dairy and beet ranch. I own one of the finest dairy and beet ranches in the San Joaquin Valley located on the Santa Fe Railway, between Corcoran and Tulare. It has two water rights with plenty of water, is fenced and cross-fenced, and has good house, large cattle barn and out buildings. Two hundred acres are in alfalfa, part of which was recently seeded. Balance in grain. Eighty to one hundred cows are kept at present, and about $5000 is realized annually from the dairy products alone. With careful management the place will pay $10,000 yearly. Two beet sugar factories are within easy reach. Owner is no rancher and wants to sell or lease to responsible party with some capital. Price $36,000. Address owner, ULRICH KNOCH, 390 S. Los Angeles St., Los Angeles, Cal.

FOR SALE—PALOMITAS VINEYARD 194 acres; 106 planted to choice Emperor, Malaga and Muscat vines, 3 to 5 years old. Part or all. Half cash, balance on easy terms. MRS. M. E. SHERMAN, Fresno, Cal.

FOR SALE OF EXCHANGE FOR LOS Angeles or Orange County walnut land, 140 acre mountain apple, berry, vegetable and chicken ranch, near Santa Cruz. WILLIAM RICHARD, owner, 438 River St., Santa Cruz, Cal.

I MAKE A SPECIALTY OF ORANGE and alfalfa ranches and exchanges. 826 Main St., Room 9, Riverside, Cal. N. R. BELL.

**MACHINERY.**

THE R. KELLY MACHINERY CO., Mission Road and Macy Street, Los Angeles, Cal., carry a large stock of secondhand machinery, boilers, steam and distillate engines, steam and power pumps and jacks, air compressers, water and oil tanks, pulleys, belting, hangers, etc. 25 car loads pipe and fittings, all sizes. Lot of iron fence posts, fine for wire fence.

FOR SALE—SECOND HAND WINDmills, tanks, pumps, engines, hay rake, cultivator, mower, wood sawing outfit, spraying outfit, light wagons, anything a rancher wants secondhand. DEMMITT CO., 120 N. Main St., upstairs, Los Angeles, Cal.

FOR SALE—RENT OR EXCHANGE, boilers and engines, gas engines, pipe and oil well casing, pumps, all sizes and makes; get our prices before you buy. A. CANNADY & CO., 691 N. Main St., Los Angeles, Cal.

FOR SALE—GASOLINE AIR RIG FOR testing wells, forty to fifty horse power. Mounted ready for use. Will sell quarter original value. BAILIE & BRANDT CO., 943 North Main St., Los Angeles, Cal.

FOR SALE—A TWENTY-FIVE HORSE power engine, suitable for pumping. Write to 1266 West 22nd St., Los Angeles, Cal.

FOR SALE—DE LAVAL SEPARATOR, in perfect condition, capacity 400 lbs. per hour. W. J. WALLACE, R. D. 1, Riverside, Cal.

FOR SALE—THREE, FOUR AND FIVE horse gasoline engines. BAILIE & BRANDT CO., 943 North Main St., Los Angeles, Cal.

**POULTRY.**

THOROUGHBRED MALTESE HEN pigeons, $1.50 pair. JOHN HERING, Mill Valley, Cal.

PURE PIT GAMES—YOUNG TRIOS, quail size, $3.50. O. L. CRANE, Route 3, Santa Rosa, Cal.

**CATTLE.**

FOR SALE OR EXCHANGE—ABOUT 40 dairy cows and about 25 head of other stock, all in good condition. Will exchange for horses. Address, N. ROUFF. Palmdale, Cal.

**HORSES.**

FOR SALE—A FEW HEAD OF UNbroken horses, three year old and past; ten two-year-old Poll Angus bulls; two Durham bulls; several yearling and two-year-old mules; three spring wagons. Address CHAS. W. HART, Farmersville, Cal.

FOR TRADE—2 JACKS, 5 JENNETS, for Jersey or Holstein cows. OLIVER & ELTER, Dinuba, Cal.

**TREES.**

FOR SALE—1500 EUREKA LEMONS, 1 and 2 years old; Blue gums, Sugar gums, and Red gums; street and ornamental trees, etc. GEO. R. WARNER, Santa Ana, Cal.

FOR SALE—EUCALYPTUS PLANTS, small orders or car lots, also take contracts growing any quantity. A. BLASINGAME, 15-23 Nineteenth St., Santa Monica, Cal.

**FERTILIZERS.**

NOW IS THE TIME
to fertilize for results in the coming crop.
ARMOUR'S "O.T.M.", "B.B.&P.", and "5-8-2" grow big crops and build up the soil. They have been doing it for years.
THE ARMOUR FERTILIZER WORKS, Los Angeles, Cal.

# WOULD YOU LIKE TO SLEEP ON A MATTRESS

Will bring you a booklet describing their famous **"Kapokeen"** Mattress, which has all the good points mentioned and many more. Write today

SECURITY is naturally the first consideration in the placing or investment of savings and surplus funds. Fifty thousand people chose this bank—not through sentiment, fancy or mere chance—but because they recognized its financial strength.

Depositors have first and only lien upon a Savings Bank's assets. There can be no preferred creditors.

You should consider these facts when choosing a depository for your savings.

Four per cent interest on savings accounts—the highest rate consistent with sound, judicious banking.

**Resources, $23,500,000.00**

**Capital and Reserve, $1,300,000.00**

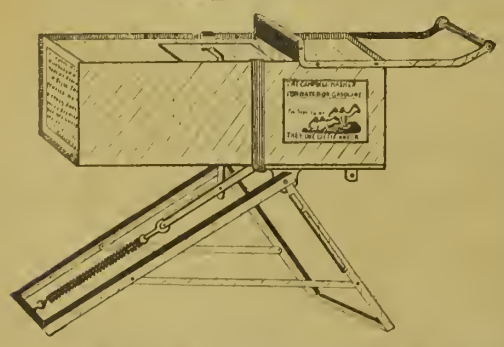
# SECURITY SAVINGS BANK

**OLDEST AND LARGEST IN SOUTHWEST**

**Fifth and Spring Sts. - Los Angeles**

# CUT OUT YOUR LAUNDRY BILL

**A Campbell Washing Machine**



will pay for itself in three months. Will wash a blanket or linen handkerchief with equal ease and effect, fancy waists or lace curtains positively safe from injury when washed in this machine. The only machine that can be used for dry cleaning with gasoline. Suits of clothing can be dry cleaned with less than 1 gallon loss of gasoline. Easiest to operate and the most efficient washing machine ever offered to the public. The air and the suds, the slides and the thuds make this washer do easier and better work than any other. A thirty day free trial and guarantee from any imperfection. Made of galvanized iron, will not fall to pieces in hot weather, nor rust.

## ALWAYS KICKING.

Kicking in the morning,
Kicking all the day;
Kicking if he's busy,
Kicking at delay.
Thus the chronic kicker
Fills his life with woes,
Frowning, grumbling, wrangling,
Everywhere he goes.

Nothing ever suits him,
Always finding fault;
Every kind of pleasure
He is sure to halt.
Scowling at the children,
Growling at his wife;
Turning peace and comfort
Into constant strife.

Kicking if the weather
Happens to be dry;
Kicking when the rain is
Tumbling from the sky.
Kicking in the summer,—
Heat hath then no charm;
Kicking in the winter,—
Then he'd have it warm.

Kicking every meal time,
Glaring at the meat;
Often he is saying:
"Nothing fit to eat."
Kicking when he's reading,
Grumbling at the light;
Now and then denouncing
Everything in sight.

Kicking in the morning,
Kicking all the day;
Kicking in the evening,
Kicking should he pray.
Kicking while he's thinking,
Kicking when in bed;
Wonder if he'll keep on
Kicking when he s dead?

## WHEN HER TURN CAME.

WHEN Miss Felicia was just Felicia Adams, a small, brown-eyed girl in pinafores, with two thick black pigtails, her schoolmates said that Felicia always lost her "turn," and it had been so, beyond a doubt.

As a matter of fact, some turns came her way, with never a thought of passing by. These turns, so determined that she should not be slighted, were of the kind most school children have a pleasure in dodging. But Felicia could never dodge.

The unlearned geography lesson singled her out as expiator for all the class and winked its many colored eyes at her as she stumbled on to disaster and disgrace, while the other culprits went scot free; the schoolmaster never failed to discover her crudely-drawn caricature of him, though dozens escaped his notice; the stolen luncheon was ever from the basket of Felicia.

In a measure it sweetened her nature, if not her life, and she learned a patient acceptance of disagreeable things before the school days passed. It was well that preparation was made, for later life had many ills in store for Felicia.

As fortune's wheel turned it repeated the school days' turns with compound interest.

Her parents died early, regretted and missed; the bank that had the small savings of Felicia fell with a crash, while all around other banks stood firm as the proverbial rock.

Romance, too, had, given Miss Felicia a wide berth. The one pink-cheeked boy who had signified devotion had left to seek his fortune and never been heard from again. Miss Felicia had a basket cut out of a peach stone, 20 years before, as her sole memento of him.

Her schoolmates had rosy boys and girls for their own whom they sent to Miss Felicia's little tottering shop, which had not been built upon the sure foundation of cash sales. She had never learned to ask for money, even when long overdue. If they paid, well and good. If not, she could but look at them with her patient dove eyes.

But there came a time when the dove eyes of Miss Felicia began to fail and her hand lost its cunning. Then, indeed, dark days descended on her. The collector for the wholesale house where she purchased her supplies came again and again—surly the first time, surlier the second, surliest the third.

He met the dove eyes that pleaded for time—Miss Felicia spoke no word—with an adamantine ultimatum: "Pay or be sold out."

Miss Felicia went over her books that night making out her accounts with shaking hands and eyes that rebelled at the strain. She could not rest till the bills were made out, till she had tried her best in this last bout with fortune.

In the morning she wrote a little personal note of apology and appeal to inclose with every bill. Then she bribed a small boy with one of her few quarters to present them at the various houses to which they were addressed.

By the next day the answers began to come in. A few of the minor bills were paid; some of the large ones were promised in the future; some took no notice, and two of the largest debtors descended personally on Miss Felicia in a very whirlwind of indignation and outraged pride. The first of these, a former schoolgirl friend, berated her soundly and then dissolved in tears.

"You know, Felicia," she sobbed, "that all the—children had—scarlet fever—and—how h-hard it has been. Of course," she could not forbear the thrust, even with Miss Felicia bending pityingly over her, "you don't know how a mother feels, nor, a wife, but I should think even you wouldn't press at such a time."

Miss Felicia kissed her, comforted her and gave her tea from her great-grandmother's quaint cups. She never thought of saying, as she might have done, that the illness was over by a year and more, and that a new horse and buggy had since been purchased by the stricken family.

The other caller was more hurt than angry. After they had talked for a while, he went away with a couple of dollars' worth of goods from her slim stock.

When the collector, still at the surliest mark, arrived, she had little for him. "The sale will be advertised in tomorrow's papers," he said, and then, as if the words were wrung from him against his will: "Very sorry, ma'am."

The shutters were put up. Through the next two days Miss Felicia cowered in the little back room, shamed and fearing, trying to think of a way in which she could still support the burden which men call life.

A knocking at the front door sounded, a fumbling at the shutters, but she paid no heed. It was only when a rat-a-tat-tat- beat on the back door that she roused herself and opened it.

There, in a flood of sunshine, stood the boy who had gone away years before, the hero of her dreams. She know him instantly, though the years

in which he had wrestled with the hard earth for the deliverence of its prisoned treasures had tanned the pink cheeks, hardened and hollowed the eyes and sprinkled the sunny hair with telltale threads of gray.

There was not in all the 20 years an event of so much importance as the accidental finding of her name in the paper.

The color crept back into her cheeks as he told how he had longed for her all the long years. For the matter of that he had half forgotten her till he read her name, yet he was quite sincere in believing that her image had always been before him.

Moreover he made her believe it, in a joy and thankfulness such as she had never known. She rested her weary hands in the strong ones stretched out to her.

The years slipped away. Life was a beautiful and glorious thing. Miss Felicia's turn had come.—Spokesman Review.

## About the House

MANY a case of typhoid fever may be traced to boxes of decaying vegetables, or piles of mouldy carpet or sacks that have been forgotten and left in the cellar. Clean the cellar just as carefully and thoroughly as you can. Clean everything and white wash every corner, putting plenty of carbolic acid in the white wash. And keep the cellar well aired. If people would only realize that fresh air and sunlight are the foundation stones of health and happiness, perhaps they would not be so niggardly in their use.

How many house-wives do you know who keep the windows closed and the shades drawn most of the time, to keep the carpets from fading and the curtains from getting dusty? But isn't it just as much a part of good housekeeping to keep the air we breathe fresh and pure and clean as it is to keep the curtains immaculate, the colors in the carpet bright or the furniture free from dust?

Have you ever gone into a house where everything was in faultless order but where the air was heavy and close and stale, and in a very few minutes you would feel "stuffy, and headachy" and as soon as possible you would get out of doors and take long deep breaths of the fresh air.

Keeping the house and furniture clean is not all of good housekeeping—you must have clean air and sunlight as well. If you can not keep the floors free from dust with fresh air and sunlight in the house, choose the dusty floors—there is such a thing as "clean dirt."

An old woman who hobbled around on her crutches caring for her house was asked how she managed. "Oh, I just do the best I can, I try to keep things clean enough to be healthy, but they are dirty enough to be happy." She was a philosopher who had learned in the hard school of experience.

Many housewives like to have an extra dessert for the Sunday dinner. During the warm months, a fruit ice or ice cream is usually liked by all members of the family. If you are too far from town for the "ice man" to visit you, whenever you are in town on Saturday afternoon, buy a big cake of ice, wrap it up in old carpet or "gunny sacks" and take it out home with you. Make and freeze your cream in the evening, pack it carefully and leave it undisturbed until wanted for dinner Sunday. If the weather is very hot you may need to add a little more ice and repack it Sunday morning. With a little experience you will find it very little trouble to have a frozen dessert whenever it is wanted.

Another "hint" was given me by a young housekeeper. One day she did not want to cook meat, but wanted something to take its place for the main dish for their very simple dinner. She had a bowl of "drippings" from a beef roast. She peeled some potatoes put them in a baking pan and baked them in the oven, basting them frequently with the "drippings." They browned nicely and were appetizing and satisfying, with a delicious meat flavor.—Elbepe.

### MONOTONOUS.

How often do we hear women sigh for nobler fields of duty than what they deem the narrow round of household tasks—the washing of dishes, the preparing of meals, the making of beds, sweeping, dusting, scrubbing, scouring. Only the other day when the subject of conversation happened to be what a woman of wealth had accomplished in a work for young women and girls, one of the company remarked: "What a blessed thing it is to do good in that way. How I wish I had the opportunity!"

Another of the company quickly turned to her and asked, "Do you not do some good then? I have frequently heard those who have found a home in your house tell of the watchful care you exercise for their comfort and welfare—of the wholesome meals, daintily served, that built up their strength for the day's work, of the tender sympathy in trouble and illness—all this is no slight service for humanity, rendered, it is true, in a business way, to those who have no other home in this large city."

It is the spirit which animates the worker that makes the difference. We may take comfort and encouragement from the words of Phillips Brooks, "Never to fear to bring the sublimest motive and the most infinite endeavor to the smallest duty." Let us disabuse our minds at once of the mistaken notion that housework is demeaning or degrading. We are to look beyond the bare fact of the work, whatever it may be, to the results aimed at. Whatever elevates the home, elevates the tone of family life, and ultimately the whole fabric of civic and national life feels the influence.

But outside of pots and pans, inevitable as they are, there is much in the ordering of every household in seemly and beautiful ways; much that lifts up housework into an art, and relieves it from the humdrum and monotonous routine of many of the occupations of life. There is the care of draperies, linen, china and silver, which gratifies the aesthetic sense at the same time engaging the attention and energies. The danger perhaps lies in too much care in this direction while neglectng the more weighty matters—the preparation of wholesome food. Taking into consideration all these things, who will say that the labors of the housekeeper, the homemaker, are monotonous?—Exchange.

### OUR MOTTO FOR THE WEEK.

Every cloud has a silver lining—
That is the side where the sun is shining;
And the way to illumine this world of doubt,
Is to wear your cloud turned bright side out.—"Pastor."

**Polytechnic Business College**

**304 12th St., Oakland, Cal.**

*(Inc.) Capital Stock, $100,000.00*

**The Great Business Training School of the West**

- Over 1000 students attending this year.
- Finest building and equipment in the U. S.
- National reputation for high grade work.

Extracted W W ..... .....7@8
Extracted light amber .....6@7½
Beeswax per lb .....24@28

### Hay.

Scott & Magner say: There has been comparatively little hay changed hands in the country during the week, as all buyers are thoroughly adverse to making purchases under prevailing conditions, as the farmers' ideas in the country are much above the basis of the San Francisco market, and those who have purchased hay and are bringing it into San Francisco are netting quite a loss on most consignments. Until these conditions adjust themselves to a more satisfactory basis, no activity can be expected.

Occasionally an exceptionally fancy car of wheat hay has been sold at our top quotations, but the majority of all arrivals of wheat and wheat and oat hay, have moved slowly under a moderate demand.

The large consumers of hay here in the city are adverse to making purchases to fill their barns at the prevailing figures; therefore the general trade has been dull and the demand for hay decidedly moderate. Many of the hay teams in the city are laid off and idle on account of this condition, and nothing better can be expected until the market adjusts itself.

There is very little activity shown on alfalfa hay. Comparatively a small amount has been arriving, but there has been enough to supply the present current demand.

Not much straw has been received here during the week, and this article is fairly steady at our quotations.

Choice wheat hay .....17.50@18.50

## Citrus Market

LOS ANGELES, July 7, 1909.

The few seedlings, sweets and other general varieties yet to go are not offered a very bright outlook. Sales for the last few days have been very slow with indifferent prices. There are possibly of these varieties not over 150 cars yet in California.

Valencias are much better and the fruit is of excellent quality as a rule. No record breaking prices have been received but the general tone of the Valencia market is satisfactory.

Extreme prices received for lemons during the heated time preceding the Fourth are not being realized at this moment though the limited quantity of fruit and lack of foreigns in the market leaves a good market tone and good prices are being received in all sections.

### Shipments.

Total number of cars of citrus fruits shipped this season since November 1st aggregate 32,101 cars, of which 27,585 were oranges, 4516 lemons. To same date last season, 25,997 cars, of which 22,477 were oranegs and 3520 lemons.

---

NEW YORK, July 2.—Twenty-nine cars oranges sold. Market firm on good stock. Weather clear and warm.

### TO DESTROY ANTS.

If ants are abundant about your premises it is probable that there are trees or bushes infested with plant lice near by. The ants visit these lice to obtain the sweet secretion which they give off. If this be the case, the first thing to do is to destroy the plant lice.

If there are large ant hills to be destroyed, the best and easiest method is to use carbon bisulphide, as follows:

Thrust a crowbar or sharp stick to a depth of eight or ten inches into the ant hill. Pour in one full ounce of carbon bisulphide and quickly close the opening with dirt. As soon as this is done, throw a wet blanket over the hill to keep down the carbon bisulphide fumes, so as to increase their efficiency in suffocating the ants. Do not remove the blanket for at least an hour. If the hill is large, it will be advisable to make two of these holes, ten inches or a foot apart.

If the ants are under the sidewalk, raise the flagging, if possible, and apply to the earth beneath, as in case of the ant hill, except that the flagging is laid back in place instead of using the wet blanket.

If ants are troublesome in the pantry, a free use of insect powder (also sold as "Buhach" "Pyrethrum" and "Persian Insect Powder") upon the shelves and in the run ways of the ants will usually be effectual in cleaning them out. As this powder is not poisonous to people it may be used in abundance.—C. P. Gillette, Colorado Agricultural College.

60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it fails to do this, **any** money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

# Some Roses of Redlands

ROSES and a profusion of flowers are characteristic of Redlands, San Bernardino County. The photographs on this page are only the merest hint of the beauty of that section lying at the base of old Grayback. In fact, the town lies in full view of the grandest mountains of Southern California. The range of which San Antonio ("Old Baldy") is the chief, bulwarks the skies upon the northwest, and east of these is the Cajon Pass, through which the Santa Fe railroad finds entrance. From these, easterly along the north, extends a rugged mountain wall about five thousand feet high until Mt. San Bernardino and Mt. San Gorgonio are reached, the former a little less, the latter a little more, than 12,000 feet high. On the far southeast rises the majestic San Jacinto. On the west the valleys lie open to the sea.

Millions of Gold of Ophir Roses

A Rose Tree

The valley varies in width from south to north, being eight or ten miles at the widest.

Redlands lies sheltered by these mountain ranges, beyond which are the deserts. It is ninety miles from the ocean. The climate therefore is very different from that of the coast towns, being much warmer and dryer, especially in the winter. Yet there is a delightful crispness and freshness in the air during the cooler months. The average rainfall is twenty inches, although during the dry years just past it has been only four or five. There are often uncomfortably hot days during the four hottest months of the year, although an occasional exceptional summer, such as that just past, glides away with scarcely a day of intemperate heat. The nights are cool almost without exception.

Today Redlands shows the greatest shipment of navels of any other one section in California.

# California Cultivator

Vol. XXXIII—No. 3 Los Angeles, California, Thursday, July 15, 1909 Subscription $1 a Year

# The Handling of Intractable Soils

## A Series of Answers to Cultivator Questions as to how "Putty" or Hard Soils Can be Handled so as to Absorb and Hold Moisture and be Easier to Till

A SUBSCRIBER of the Cultivator recently called at the office perplexed as to what to do with his soil. So far as he could judge the chemical condition of the soil was favorable for a good crop; the trees did not indicate any material lack of fertility, and were in fairly healthy condition; but the crop produced was not such as he desired. One thing in particular that he noticed was that the soil failed to take in water. In other words, as nearly as could be determined, it was a "putty" soil which needed a material "lightener" and "loosener." Of course the manner of securing better mechanical condition can only be determined definitely by observation of the ground, knowledge of the surroundings, sub-soil, etc., but in order to get as much information as possible on this subject, the following statement of the case was sent to a number whom we know to be qualified to speak on the question:

**Statement Of The Case.**

Our inquirer says that in irrigating he runs the water twenty-four hours, at the end of which time, the flow is reduced somewhat and continued twenty-four hours longer, but even then the water does not sink into the soil as deeply as he would wish, and his trees fail to bear heavy crops. They are oranges. The soil is intractable and putty like. Of course we have told him that it appears to need humus and possibly an application of lime. He says that two and three years ago he grew heavy crops of peas. Both crops he insisted were very high and hard to plow under. Last year he did not grow a green manure crop. He has no money to waste, yet he feels that he must get the soil into better condition and is willing to apply gypsum or lime or any fertilizer recommended that looks as if it would give him reasonable results.

Can you give any hints on the handling of such a soil? In case lime is recommended, what is the cheapest and best form in which to get it? Is the sugar factory lime desirable? Should the air slacked or fresh lime be used? How many pounds per acre may be safely used on such heavy soil?

* * * *

One of these was sent to Prof. E. J. Wickson, who is at the head of the Agricultural Department of the State University. He writes us as follows:

**Prof. E. J. Wickson, State University.**

Your advice is as good as could be given. He can overcome the great obstinacy of the surface soil by the use of lime—whatever form he can get cheapest—common builders as it is; air-slacked which sometimes costs much less; refuse lime from the kilns if near enough to haul from; sugar lime; gypsum—all of them make an adobe soil more granular, easier to work, less disposed to surface evaporation, etc., and more ready to dispose of surplus water which may injure his trees. But humus is the principal thing. He probably let his peas get too high and his soil too dry and hard for covering under well. When that is done a cover crop is a hardship and probably a net loss also. Lime can be used at 1000 to 2000 pounds per acre, though people generally begin with 500 pounds. It should be applied just before the rains in the fall or winter, or any other convenient time before irrigation. It is generally broadcasted and plowed or disked in.

* * * *

Prof. Loughridge, also of the State University, says:

**Prof. R. H. Loughridge.**

The San Fernando man has a soil that is evidently in great need of something to loosen it up and permit the percolation of water as well as aeration. The remedy seems to be the application of 1500 pounds of lime per acre, plowed well in, and the growing of a green manure crop of large foliage and deep root system, which can be turned under to decay; if the growth is so great as to appear unmanageable, he can roll it down in the direction of plowing, or cut it up with a disk, and then turn it under by the plow. The decay of the roots as well as of the green stuff will loosen the soil, and the lime will hasten decay. An abundance of straw plowed in will also help to loosen the soil but its decay will be very slow and add nothing to the land. The lime from the sugar factories is excellent as it is already slacked. If fresh lime is used it should be airslacked before being put in the soil, as its strong alkalinity or caustic nature might injure the roots of vegetation. I do not think that a fertilizer is called for at present to improve the land.

* * * *

**Mrs. M. E. Sherman, Fresno.**

For the present I should open up this land with a deep furrow trench between each two rows of trees and put the water down to the bottom of it. Then on a small square of a hundred feet I should apply two hundred pounds of gypsum, and on another square I should put fifty pounds of lime, using sugar lime on one portion and fresh lime on the other. As a rule we do not like unslacked lime as it is drying in the summer. This would be enough to test the matter and not too expensive. Next fall I should plant a wide or narrow strip of alfalfa between at least every other two rows of trees, if not between every two, leaving room between the trees and alfalfa to run one furrow. As the alfalfa is watered, the water sinks down along its roots, going deeper and deeper all the time. Use the clippings of the alfalfa to spread on the rest of the land. If the alfalfa is cut often enough to keep it down, these clippings are short enough to be turned under and may be put in the space between the rows. If this is not regarded as leaving enough land to cultivate, planting the alfalfa between every other two rows and plowing the cut alfalfa in green on the alternate rows will bring the orchard into condition rapidly. Sow gypsum on the alfalfa at the rate of 200 pounds to the acre twice during the season, and it should be sown on the green alfalfa being turned under. This makes the alfalfa roots do the plowing and mellowing of the soil. After four or five years, the alfalfa may be plowed up and planted in the cross direction. If barnyard manure is spread on the alfalfa during the winter and a little bone meal with it, the alfalfa crop may be regularly harvested and used for hay, but it is not advisable unless the manure and bone meal are put on freely each season.

* * * *

The next opinion is from a fertilizer man whose entire business is the handling of commercial fertilizer. He recognizes the fact that proper mechanical condition is one of the first qualifications of soil, and until that is secured, nothing can be gained from the application of commercial fertilizers. It goes without saying that once this condition is secured, the application of commercial fertilizers will be of advantage. This writer says:

**Mr. H. E. Collins, Vice-Pres. Agricultural Chemical Works, Los Angeles.**

A sufficient amount of lime to improve the physical condition of this soil would in my opinion be sufficient to cause damage to citrus trees, as their tolerance for lime is very small.

I would suggest that the gentleman in question use plenty of barnyard manure, the more straw in it the better, or a ton to a ton and a half of straw per acre disked in.

The trouble with the soil in question is that there is no lateral distribution of the irrigation water, therefore the food for the roots is restricted and this naturally shows in the falling off of the crop production of the grove.

When the physical condition of the soil is improved to such an extent that the proper distribution of water takes place then fertilizer can be applied to advantage. At present I should say that he had better spend his money toward the end of soil improvement as no doubt there is inert plant food which is yet to be taken up provided that it can be put in such a condition that the roots can absorb it.

* * * *

If a sugar factory is near enough, we presume the sugar lime would be the cheapest form to secure. On this point, we have the following from Mr. Neff:

**Mr. J. B Neff, Anaheim.**

The analysis of refuse lime from beet sugar factories is given as follows, in available material:

Potash in one ton of lime, 1 pound.

Phosphoric acid in one ton, 41.6 pounds.

Nitrogen in one ton, 5.6 pounds.

If these elements were bought in the open market they would cost about $3.50 for the amount in one ton of lime. If the lime is needed on the land a further value would be added.

One thousand pounds of such refuse lime should be ample for any land and need not be applied oftener than once in three or four years.

The above shows that sugar lime contains much fertilizing material besides having a good mechanical effect on the soil. Cost of using will of course be regulated by distance from the factory and conveniences for loading. Lime dealers have offered airslacked lime at a very low price so that in any case the addition of lime is not very expensive when the limited amount required is taken into consideration.

* * * *

**A. W. Jones, Los Alamitos.**

While we believe that sugar factory lime would

# With the Citrus Growers

### WHITE FLY STUDIES.

In Investigations into white fly conditions, E. W. Berger of the Florida Experiment Station determined as to effect of fungous diseases on the pest and has issued a bulletin for Florida fruit growers. From it we quote:

"Six fungous parasites are now known to infect the larvae of the whitefly and a seventh infects both larvae and adults. Methods for introducing whitefly fungi are considered at some length. The writer is of the opinion that by following the recommendations here made regarding parasitic fungi that their efficacy can be doubled and a clean fruit produced two years out of three.

Two fungus hyperparasites, Cladosporium sp. and coniothyrium sp., are reported. The former frequently over-runs and destroys red and yellow Aschersonias, while the latter occasionally over-runs pustules of the brown fungus, chiefly after the latter has become old or weakened from drought or cold weather.

The food plants preferred by the whitefly include two native species, prickly ash (Fagara clava-herculis) and the wild persimmon (Diosphyros virginiana), and several introduced species, namely, all varieties of citrus, chinaberry, umbrella tree, cape jessamine, privets, and Japanese persimmon. The author lists 18 additional species of food plants which the whitefly sometimes infests. Chinaberry and umbrella trees are considered as the food plants most to be feared by citrus-growing communi ties. Investigation has shown that whitefly larvae and pupae can continue to live on leaves which have dropped from trees during winter if protected against complete drying up, and that these insects may mature sufficiently late in the spring to infest the new leaves. Defoliation is not recommended as a means of checking the whitefly in a grove except when the defoliation has already been in a great measure accomplished by a freeze.

The author has found the citrus whitefly in Florida to consist of two distinct species and here presents a description of the second, a new species to which he has given the name Aleyrodes nubifera. The eggs of the new species are reticulated instead of smooth like the eggs of A. citri. Distinct differences also exist in the first and fourth larval stages and in the pupae. The adults of A. citri have immaculate wings while those of A. nubifera have a smoky colored area near the end of the wing easily visible in the living insect with the aid of a lens.

### GREATER CARE IN FRUIT DELIVERY.

The Upland Citrus Association which has a record for marketing some of the best fruit grown in Southern California, which has brought it exceptionally good returns in the past, proposes to use still greater care in the handling of this fruit in the future. Many growers have followed the rules which have been established, but others have presumed on the good nature of their fellow members by being somewhat careless in delivery, that is, sun and dust have been allowed access to the fruit in a way which has affected its appearance, if not its quality. The work of Mr. Powell and the observations of keen eyed fruit growers have proven conclusively that a little extra care means money. The circular quoted below shows that the Upland Association proposes to use still greater care. Other associations which may not be following the plan suggested in the circular will watch with interest the returns coming to this association which is using the greatest care in handling its frult.

A Basketful of Redlands' Best.

The following is practically the full text of the circular:

"The need of covering citrus fruit after picking when it stands in the orchard or on the wagon, and while in transit to the packing house, is generally acknowledged by orange growers, but has not been practiced in most cases by our members, though their attention has often been called to it. It is especially necessary to keep off the burning rays of the sun at this time of the year, but all the year 'round, day and night, covers are needed to keep off the dust, or the rains or the dew and fog.

At the last meeting of the board of directors of this Association, it was unanimously, resolved:

That our growers be required when having oranges picked, to see that the boxes containing fruit be stacked five high on the north or northeast side of the tree, with the top box covered, that loads on wagons be covered whether left standing or while being hauled to the packing house, and for all loads, delivered after June 20th, which come to the packing house without being covered, there shall be a penalty of a quarter of a cent a box to be charged to the account of the owners of the fruit.

Members will please take notice of the above rule and save themselves expense by allowing no oranges delivered from their groves without covers over the load."

# Deciduous Fruit Culture

By J. W. Mills

## FRUIT TREE MAKING.

THE success of an orchard, like that of a farm, after the site has been selected, must depend upon the quality of the material used to stock it. This is a primary principle, and, therefore, of no small importance. Apart from variety, which may be according to the wish of the owner, or the requirements of the market, there is the vigor of the stock to be considered; and vigor and health are what stand at the back of all else that can be expected from any living things. Too often orchards, or parts of orchards in poor places, have failed simply because the trees were not vigorous enough to meet the demands made upon them by the situation. Whereas, had they been a degree or two more vigorous, they would have been alive and profitable today. Youth is the critical time; if the rule is recognized and acted upon in connection with farm animals, why not with fruit trees?

### The Public Taste.

The making or marring of the orchards of the future lies in the nature of the young trees, which are turned out in tens of thousands annually from the nurseries. It is a fact that the larger the tree the less kindly it takes to transplanting. It is not to be supposed that a tree that has made good its foothold into the soil, and has adapted itself to the climatic conditions, will take so kindly to removal as one not in that condition. It has been proved that the yearling tree gives the best results. Further, in order to comply with the public demand, the growing stems of young trees are pinched in order to make them throw out second growth to form a large head. Though this head may be large in appearance, and seem "a lot for the money," it is not so in vigor and in quality. Shoots, which are forced late, cannot be equal to those that take full six months to mature, and shoots of this "unripe" character can never form the basis of a sound head to the fruit tree.

Again, the headed tree is already formed as far as the trunk is concerned. The trunk can neither be lengthened nor shortened, and must remain at the eighteen inches or two feet allotted it in the nursery. It is folly to plant an orchard of mixed varieties on one length of trunk. Strong varieties may be too powerful, and weak varieties too sickly to fruit well if both are on a two-foot trunk. The trunk must be allotted according to the inherent nature of the tree; a Jonathan apple, for instance, on a one-foot stem, and a William's Bon Chretien pear on a three-foot stem, would both, under similar treatment, give an equally profitable result. Any given variety of tree, also, if planted out of its natural climate, that is, to the north or to the south of conditions best suited to it, must have its trunk shortened in proportion; so the fruit-tree planter should aim at giving his transplanted trees as little check as possible, and he should also have it in his power to make the trunks of whatever length he deems necessary in his district.

### The Kind of Tree to Plant.

The kind of tree suited to these requirements is undoubtedly the yearling whip, that is the season's clear growth from the bud (which should be near the ground), not interfered with in any way during growth. The growing of this whip entails absolutely no work in heading and trimming, and so the cost of production is considerably reduced. Nature is allowed to produce the yearling tree in her own way, and no improvement on this can be imagined. There are other advantages which tell heavily in favor of both the nurseryman and the buyer. Besides being cheaper to rear, as well as stronger in constitution, these yearlings are, in the replanting season, very much easier to handle. They are compact in growth, and light in bulk, easy to pack, and cheap to carry.

There are, however, some difficulties to consider by the way. Many varieties will not throw clean whips in the nursery under the existing conditions of open planting for cultivation. They spurt laterally from a number of the buds. This is a sign of vigor to be welcomed in young trees. The apex of the shoot, growing upward as fast as possible, is still not able to absorb all the sap sent up from the roots, so the surplus must break out in other parts. Strong shoots at the top of a young fruit tree often behave similarly, while those in more crowded parts remain as single whips. There are two ways of treating these growths. In most varieties they can be cut, in the pruning season, cleanly away, and there are found at their base one or two developed buds ready for growth in spring. Or, if these base buds are not present, the three best branchlets, about the height at which the trunk is to be cut, can be left and pruned to throw shoots for the permanent branches. In this latter case, the shoots thrown from these branches will be vastly superior in quality to those thrown from the pruned second growth of headed trees.

## HOW TO EXTERMINATE GOPHERS SQUIRRELS AND RABBITS.

These pests cause damage amounting in this state alone to more than a million dollars a year. One of them only can we hope to entirely exterminate, namely, the squirrel which we can kill either by the use of poisoned grain or carbon bisulphide. If we use the grain it must be in liberal quantities. If we fail, it is rarely the fault of the grain, but ours in using too small quantities at a time. Squirrels are very shy, and for every one you see, there are a dozen out of sight.

Place a large tablespoon of poisoned grain—two or three to a hole—in such places as the squirrels are most likely to see it. Next day fill up all the holes and give no more grain for a week, or until the consternation caused by so many deaths has subsided. If you do, the squirrels will begin to associate the increased death rate with the grain. After a week go through the field as before with the grain, and again cover up the holes. Should any of the holes be again opened up, use the carbon bisulphide. Put a tablespoon of it on a ball made of rags, and thrust it into a hole as far as you can. Close the hole quickly (first having seen that all connecting holes were closed). If they are not, the squirrels will escape by them. It is well to look close for these holes as some are not used for entrance, but merely for ventilation. These latter go straight down and are rather hard to see.

As squirrels are very gregarious, it is necessary not merely to kill your own, but your neighbors' as well, or your field will soon be full of them again. The best time to use the grain is during the fall and winter when there is plenty of green feed and no grain left in the fields.

### Gophers.

The only reliable means of exterminating gophers is by trapping them. The box trap is best, but I use all kinds, finding that some gophers refuse to be caught in boxes. Here indeed, variety is the spice of death. It is almost useless to try to poison gophers as they are very sagacious. Some people claim that they have rid orchards of this pest by poisoning, but it is the clean cultivation that causes them to vacate, as they do not like the one-sided diet of tree roots

The box trap is not properly made. It should be longer and have open ends. This extension is merely to make the inner end where the trap part is fastened, lock more securely. The traps should also be of two sizes, one for young gophers and one for old ones. The size of the hole will indicate which size of trap is needed.

It is of no use to try the bisulphide on the gophers as they bank up against the gas and protect themselves. Poison they will eat only occasionally when food is very scarce. Then prunes and carrots form the best bait. Do everything to kill them,

**Rabbits.**

Rabbits have until recently been the one pest that I have found it all but impossible to protect myself against. It was not until I conceived the idea of using a poisoned liquid on the leaves that I felt at all safe. Through the assistance of Prof. Wickson I have recently perfected a syrup poison that they will eat, that is most terrible in its effects, and at the same time does no harm to tender plants. I place a drop of this syrup with medicine dropper on one or two of the most appetizing looking leaves in a hill in about every fifth row—closer than that in spots where the rabbits enter—and repeat every five days until the plants are beyond danger.

**Formula For Poison Syrup.**

Dissolve one-eighth ounce strychnine crystals in strained juice of two ordinary lemons and shake until dissolved. Dissolve three-sixteenth ounce cyanide of potassium in three tablespoons of hot water. Combine two mixtures and add double their quantity of honey and one teaspoon of oil of rhodium. Be sure to get the genuine as imitations of this oil are useless for this purpose.

**Formula For Poisoned Grain.**

Same as above except that twice as much water and half as much honey is used. This is sufficient for about seven pounds of grain. Let it stand covered in an iron vessel for twenty-four hours and then dry.—J. C. Oestergard, Burbank.

## LOSS OF SOIL FERTILITY.

Of course there is loss of fertility in the soils. Never was a crop garnered without taking from the fields something that the soil gave up to make the stalk, the leaf and the grain.

Every load of hay takes from the farm some fertility. In each bushel of corn or wheat is a certain amount of the elements of fertility which is carted away to be sold. This is a continuing process.

But the men who have taken the soil into their great chemical laboratories have figured out just how much material there is in the soil that may turn up some time as plant food, and it is astonishing to discover that the supply is very large. Of some of the elements it may fairly be said the supply is inexhaustible. Of practically all there is enough.

But despite this, there is complaint—and it seems to be growing louder all the time—that the soils are being worn out and that the loss of fertility is such that soon the farms will be ready for abandonment. What's the matter?

It is all in the method of cultivation.

Farmers who do good farming, who cultivate well and take care of their fields the year round, are not "viewing with alarm" the prospective depletion of their soil.

Some things may be suggested to help. First, keep live stock on the farm and feed as much of the crop as possible. This will not be a complete solution of the problem, but it will help a great deal.

Incidental to the keeping of live stock on the farm, make good use of the manure. A hint is enough.

Provide drainage where drainage is needed, or where it may be needed very badly at some special time.

Use good seed at all times, not only as to variety but as to the selection of the seed itself and the care of the seed. Have the seed tested. Change seed sometimes, getting it from other fields or exchanging with distant neighbors.

Use different crops. Rotation is worth something. Its chief benefit, however, lies in the fact that it compels better treatment of the soil itself by requiring different kinds of cultivation.

**A Calexico Water Canal.**

Don't waste the water. Don't let the field lie fallow. Don't permit the seeds to suck the life blood out of the soil.

And it all resolves itself into the problem of scientific soil culture—the treatment of the soil so as to secure a good tilth and to make a proper seed bed for the seed and to prevent loss of moisture. Cultivation looks to keeping within the soil the proper amount of moisture and air so that the processes of decomposition may continue right along and thus the store-house of soil fertility will be of some use to the farmer.

Scientific soil culture means that the soil is to be kept up all the time and avoidance of loss of fertility.—Campbell's Scientific Farmer.

## BUDDING.

The first thing to do is to grow the stocks. Peaches are sometimes budded on plum stocks, but the general rule is to bud them on peach stocks. These are grown from peach pits. The best commercial supply of pits comes from the high lands of North Carolina and Tennessee, from so-called wild or native trees. The cheap supply comes from the canning factories. In growing only a few trees in a small garden, no great trouble need be spent on finding seed. Almost any seed which will grow can be budded and will answer fairly well. These seeds are planted in drills early in the spring and can be hoed and managed like any garden crop. They should have a good warm soil with enough cultivation and fertilizer to make a strong growth. Weak-growing stocks are worse than useless. The budding is done whenever the stocks are in good condition; that is, as the budders say, "whenever the bark will slip."

The buds to be used are cut just before using from trees of the proper variety. Strong, clean shoots in full growth are chosen, but they must have some good, sound, mature buds, at least toward the base of the shoots, and only these mature buds are immediately trimmed by removing the immature tips and by cutting off the blade of each leaf, leaving the petiole or leaf stalk. Everything being ready the stocks are prepared by pruning or rubbing off the leaves and small shoots near the base. The stock is then cut with a T-shaped incision. The lips of this incision are opened with the point of the budding knife. This is the most delicate and important operation in budding, and on its proper performance largely depends the success of the job. The bark must peel loose freely from the wood below. It must not break or tear.

The bud is then cut from the scion, and inserted in the opening provided on the stock. The bud is then tied in with raffia, soft twine or waxed cloth and the operation is complete, at least for the time. The graft thus formed has to be watched, and after ten days or two weeks it will be found that the bud has set—that is, grown fast. The diameter of the stock will be found to be increasing also and the ligature will be cutting into the stem. The binding is therefore cut. The bud should remain dormant until the following spring. At that time the stock should be cut off down to within about one inch of the inserted bud, and care must be exercised during the early summer that growth starts from the bud and not from the stock.

The people of California seldom realize the magnitude of the apple business of the Pajaro Valley. This paper stated in an editorial some time ago that it was greater than that of the entire state of Oregon. We now learn that it is greater than that of the two states of Oregon and Washington combined. California is surely up to date in the advertising of her resources, but in the matter of apple production we have not fully appreciated our greatness, neither our possibilities of development.

# Live Stock and Dairy

By Mrs. Minna E. Sherman

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

## STIFF SOILS.

A LITTLE while ago there appeared in the Cultivator an article on growing young vineyards, that incidentally spoke of handling stiff soils, and seemed to have raised considerable interest and several letters came asking for further opinions of the dairy editor on the subject. After that fine special edition on alfalfa of last week, this department may take the liberty of wandering from the set topic of live stock.

In Fresno county, the red colored heavy soils are usually called the "hard lands" in distinction from the lighter sandy soil and the white ash soils. There is also a red ash soil in some parts of the county. The hard red lands are often underlaid with hard pan and will hold the water all season. It is this soil that makes commercial brick, as well as the haviest meatiest raisins. It also grows plums, olives, late table grapes and barley to the greatest perfection, while the lighter soils are sought for malaga grapes, peaches, apricots, alfalfa and garden truck. The red hard soil must be handled at exactly the right degree of moisture or it will break up in great clods. After it is very wet if it is allowed to remain uncultivated, it checks open in great cracks during the summer and the little moisture that is in it escapes. When turned up the next season it comes up in great pieces divided by the cracks of last season and is, after all, only rough sun baked adobe bricks. When land like this has to be handled, if it cannot be plowed when it is exactly right, it should be run over with disks or with pony gang plows to roughen the surface. It will then retain the moisture and be ready to plow up in good shape when the time comes to get to it. Often to plow this tough land deeply at first, is merely to make it into great clods. The small two-horse revolving harrow has come into use in California and when the land is in good order it does good work, but it is also a gay deceiver in that it covers up the small and large clods with the loose earth. The first season's rain shows up the apparently well cultivated vineyard to be a mass of small clods that had been buried, not broken up.

### Humus.

Clods should not exist, neither should clod hoppers, and by the addition of humus to the soil and the addition of intelligence to the man with the hoe, both will pass away. Humus, aside from its value as a fertilizing agent, has in stiff soils the property of holding thirteen times its own weight of water, and holding it among the closely packing particles of the clay makes it flocculent. The word "flocculent" comes from the flock of wool and it is used to apply to spongy, light little bunches of soil that remain soft and moist under all states of the weather. Instead of having to wait until the soil is just right to plow, the condition comes about that the soil is right all the time when it is humus filled. The mechanical improvement will pay alone all expenses of adding humus to the soil.

### Cover Crop.

The usual way to produce humus is to grow it in the form of legumes. The term of cover crop is now used to designate the plants that are nitrogen producers, such as the legumes. The one error that comes up constantly in the way of handling these crops is that they are not plowed under soon enough. The time to turn them under is when they are in blossom. Then the stalks are not woody and will rot at once. The actual amount of nitrogen is also at its highest at this time and not in the later stages. When a woody growth is turned under, it dries out the soil and remains there, to be turned over again at the next plowing. Where the growth is very high the disks set on a slant may be run over it and then the plows will completely cover it. I have had the joy of having peas grow tall enough to be able to run the mower and take off half for hay, then, spread the rest on the land and plow it under. This, however, will not happen often enough to make an embarrassment of riches. Tangier peas are proving good growers and will make growth enough to go under in April. These peas have a brilliant red blossom, and one lady planted them for the bloom in a border along a drive way. The Tangier pea, the common garden pea, and the Canadian pea, with winter vetch and burr clover, make the winter growing cover crops, while for summer growth the southern field pea, cow pea and the soy bean are among the earliest handled.

### Mulch.

During the summer after the last cultivation the entire ground may be covered with stable manure to act as a mulch. I like this particularly in a young orchard as it makes the land in fine condition to turn under early in the fall. In orchard land we often meet in stubborn soils, a condition like this. The water refuses to penetrate deeply and the trees look yellow. This condition can best be met by running between the rows deep furrows—one or two according to the size of the trees—and then running a V to make the trench at least twenty inches deep, while thirty is even better. Fill these trenches with strawy manure, wood ashes, old clothes, weeds clipped from the road side and a little sprinkle of gypsum to hold the ammonia from escaping. Run the water in the trench and when dry enough cover with earth. These trenches can be opened as needed and in a couple of years the trash of leaves and other vegetable matter usualy wasted and burned may be used to make fertilizing material. Bury everything you cannot use; it will help the stiff soil. Another way to secure humus and nitrogen on this stiff land is to plant a wide strip of alfalfa between each row of trees, water this, use gypsum on it freely and give it a little commercial fertilizer from time to time. The roots of the alfalfa penetrate and carry the moisture down. After three or four

# The First Perfect Feeding Device for Cream Separators

We have frequently referred to the recklessly untrue statements and claims made by "desperate would-be-competitors" struggling to retain Cream Separator business that is going to the **United States Separator.**

We have repeatedly proved by the records of the United States Patent Office at Washington and by the records in the United States Circuit Courts, also by the records of International Expositions and National Expositions, that most of the claims of these would-be-competitors are false.

They are using desperate and false claims in their efforts to make it appear that they are first in everything desirable in Cream Separators.

The **United States Separator** was the first to employ a feeding device in the Separator bowl to deliver the whole milk beyond the cream zone. This device of the United States prevents all conflict of currents and any remixing of the cream and skimmilk in the process of separation. **It is far superior to any "split wing" device,** more perfect in operation and has won the International prize for the most perfect separation.

The "disc" Separator could not use this device and in its efforts to equal the device of the United States was compelled to resort to an inferior expedient—the "split wing." But the "split wing" does not enable them to equal the United States, as the records show.

The **United States Separator** was the first to distribute the incoming volume of whole milk back of the cream wall.

The **United States Separator** was the first to use nonaligned channels for the currents of the milk through the Separator bowl, on which it holds strong patents, and no others can use this construction and it was the **United States Separator** that beat the "disc" Separator at the greatest International contest of Cream Separators ever held.

The "disc" Separator has never been able to equal this test.

It was the **United States Separator** that beat the "disc" Separator in its own County Fair test and recovered more butter in the cream than the "disc" Separator recovered.

The **United States Separator** is manufactured under patents owned by IT.

The **United States Separator** is the originator of the best things in Separator Improvements.

The **United States Separator** is not an imitator in any particular.

years plow the alfalfa under and plant the cross rows with it. The alfalfa cut from this if quick results are wanted may be buried in cross trenches or it may be used for the horses and made to pay for gypsum and commercial fertilizers used. I am watching a neighbor's orange trees improve under this alfalfa treatment and it is marked, when one knows, how these trees looked two years ago.—M. E. Sherman.

### YOUNG PIG MANAGEMENT.

A hog is half made when past the weaning period without a stunt or kink in its growth. Every check or halt in prosperity through its first two months is more expensive than at any later period. Too much rich, feverish milk of the dam, causing thumps or other ailments, may leave harmful results, perhaps as much so as scant feeding or other neglect of the sow. More injury may be done to a pig's growth in two or three days than can be repaired in a month, even if he is made the subject of special care, which where many are raised is not the rule nor easily practicable. "Good luck" with pigs calls for attention, and that not occasional, but frequent and regular.

From the first week after farrowing until weaning time the sow will be little else than a milk machine, and to be a high-power machine in perfect operation she must have proper care. Nothing else is so well calculated to make pigs grow as a bountiful supply of wholesome sow's milk, and the pigs that have plenty of other feed with the milk of a well-slopped sow for eight weeks will ordinarily have much the start of those weaned at five or six weeks, no matter now much food and attention the earlier weaned pigs may have had.

At eight or nine weeks old most pigs are, or rather should be, fit to take away from the sow; some litters are individually older at seven weeks than others at ten, and better fitted for weaning. Sometimes it is necessary to wean when the pigs are five or six weeks old, and in other cases it may be advisable to wait until the pigs are ten weeks or even older. In the corn belt the period will generally average longer than in New England. Breeders who wean at early ages generally do so in order to more profitably raise two litters a year.

Provided with and taught to eat suitable feed some weeks beforehand pigs are not noticeably checked in their growth by weaning, but those that have been dependent mainly upon the mother's milk, when abruptly taken away from it, frequently seem to have their growth partially suspended for weeks. Many breeders successfully let the sow wean her pigs, as she will in time, and the change is so gradual that no pause in growth indicates when the milk diet ceased. A modified application of this, in which the pigs are separated from the sow at an age suiting their feeding and the convenience of the breeder, will not infrequently be found advisable, but by no means should the pigs be allowed to remain with a sow until she is virtually devoured by them as is sometimes done.

It is not a good plan to take all the pigs from the sow, unless one or two of them can be turned with her some hours after, to draw the milk she will have at that time, and again, say after a lapse of 24 hours. The preferred way is to leave about two of the smallest with her for several days, and after that leave only one for two or three days more, by which time the flow of milk will have been so gradually diminished that no injury to the sow will result by keeping them entirely away from her. This extra supply of milk helps also to push the smaller pigs along in growth and put them more nearly on an equality in size with their thriftier mates.—From Coburn's "Swine in America."

### A FIGHT ON CONDENSED MILK.

A correspondent from Oregon to the Creamery Journal, Mr. A. E. Guyton gives an account in that paper of a trade war that is on between eastern condensed milk interests and those of Oregon and Washington which we reproduce below. While we do not know the facts sufficiently to vouch for all that is given, we do know that there is not the best of feeling among the large condensing interests of the East toward the growing industry in Oregon and Washington. The article is as follows:

Manufacturers of unsweetened condensed milk on the Pacific coast have become involved in an industrial war. The battle is on and it promises to be a bitter contest. The standpoint of the coast condensaries in this fight against the Borden trust of the East is interesting as it will likely prove fatal to at least some of the smaller individual condensaries of the coast country.

According to the statement of some coast owners of plants the trouble started last winter when the makers of the Carnation brand, operating six condensaries in Washington and Oregon, sent a surplus of 20 carloads of cream to the New York market. It seems that the Borden people regarded this as an encroachment upon their territory, or at any rate answered this action by coming into the coast country with their product offered at a low figure. The cutting of prices has forced some of the coast condensaries to sell at a figure lower than the cost of production and of course a continuation of the price war will be disastrous. Many of the western condensaries are individual affairs located at different points and are not large enough to stand the loss for any great length of time. One of the plants affected is the Coos Bay condensary located at North Bend on Coos Bay and making the Sunrise brand. Manager Stewart, who is in charge of the concern, and who with his father, G. H. Stewart, was connected with the first manufacture of condensed milk on the coast, states that his plant can live through the fight. It is located where it has the advantage of cheap water transportation for the output and secures the milk with the use of its own gasoline boat. The boat pays its own way with general freight and passenger work so the milk is practically without cost. The plant can manufacture as low as 75 cases of milk a day and do it as cheaply per case as can a factory turning out 1,000 cases a day. However many of the Oregon and Washington condensaries are not as fortunately located and must consequently suffer if compelled to sell at a low price.

The industry of manufacturing unsweetened condensed milk on the coast has grown wonderfully. The first was made at Highland, Ill. The

first factory on the coast was established by G. H. Stewart, at Buena Park, Cal., and the "Lilly" brand was made. The company now owns a plant also at Tempe, Arizona. Other factories have sprung up and there are now probably 20 plants in operation in Washington, Oregon and California. Some were started by salesmen for machinery and were established under unfavorable circumstances and in bad localities and have not been successful. Others which have heretofore done a good business are now facing the fight of the eastern trust which will cause them to suffer. There has been some talk of forming a combine of the plants on the coast in order to better fight the eastern concern but it is not likely that this will be done as the stronger of the factories do not feel like shouldering the burden of the weaker institutions. While the creameries of the coast are enjoying prosperity the condensaries are starting into a fight for their existence.

Libby, McNeil & Libby, the Chicago packers, are opening a large condensary near Eureka, Cal., and it is believed that the big eastern concerns are establishing themselves on the Pacific coast with a view of securing large trade in the future with the Orient and more particularly China. With this future market in sight the fight of the various local coast condensaries for life becomes an important one from their standpoint.—Pacific Dairy Review.

## TUBERCULOSIS IN HOGS.

Reports gathered from the various meat-packing centers of this country show tuberculosis of hogs to be on the increase and causing heavier loss to raiser and packer alike than any other disease.

Statistics show that a year ago there were over 56,000,000 hogs in this country and their value at that time was over $339,000,000. Federal inspection at the abattoirs of the country show 2 per cent of the hogs slaughtered to be affected with tuberculosis. Reports from Europe show a far more widespread infection that runs as high as 5.5 to 7.5 per cent.

The small amount of money required to start in the hog raising business and the quick returns on the amount invested make it an attractive field for operations. Hogs will make greater gains on less feed than almost any other live stock and at the same time utilize profitably waste food products of every variety if properly prepared. As tuberculosis of hogs is chiefly contracted through feeding, the significance of the latter feature is obvious.

Hogs from Arkansas, Oklahoma, and Texas are remarkably free from tuberculosis, due to the methods of caring for them, or rather the lack of care. They are not restricted to feed lots, where disease is commonly found, but roam over large areas to shift for themselves. No prolonged feeding is practiced in narrow limits, but from birth to maturity they are pastured on alfalfa, oats, corn, rape, and peanuts. Hogs raised in the forest regions of Hungary are likewise rarely affected with tuberculosis. In striking contrast are the hogs slaughtered at three cities in one of the leading dairy states where there are a large number of co-operative creameries and the raw skimmed milk is fed. Samples from two of these creameries were injected into guinea pigs and in one instance virulent tubercle bacilli were recovered .

Buyers for packing houses are learning from bitter experience to avoid sections of certain states, and two firms will not buy hogs from one state known to be badly infected. In fact, many of the smaller packers in the Central West buy subject to post-mortem inspection as a measure of self-protection.

An investigation carried on by the Bureau of Animal Industry in a certain section of the Middle West consisted of tagging hogs hauled to market in wagons. Of 3,420 animals tagged it was learned that all of the affected stock came from less than 6 per cent of the farms.

It is known beyond doubt that the majority of tuberculous hogs are produced by the following causes:

1. Feeding raw milk and slime from creameries.
2. Feeding hand-separated milk from tuberculous cows.
3. Feeding behind tuberculous cattle.
4. Feeding tuberculous carcasses.
5. Feeding slaughterhouse offal.

The danger in feeding hogs behind tuberculous cattle lies in the fact that such cattle discharge enormous numbers of tuberculosis germs in their feces.

Sooner or later the packer will buy subject to post-mortem examination, as some are now doing with certain classes of female cattle. Then the hog raiser who persists in fattening with tuberculous material will be made to feel the cost of his indifference or lack of knowledge. Today the buyer makes his purchases with the knowledge that a proportion of his animals will be condemned and the price fixed accordingly, with the result that the careful breeder suffers with the careless one. This is not equitable. But when the packer buys subject to post-mortem results the painstaking and intelligent raiser will receive more than he does now and the ignorant or indifferent breeder will get less, which is more nearly a fair deal for all concerned.

---

The Arizona Wool Growers Association held its annual meeting at Flagstaff July 7th and elected N. W. Perkins of Flagstaff, President, and L. D. Yaeger of Flagstaff, Secretary and Treasurer.

---

Stanislaus county produced four million pounds of butter last year, which makes it the second county of the state in butter production.

## ALFALFA PASTURE.

Alfalfa should never be pastured during the first or second season of its growth. Even an old field of alfalfa should be grazed rather sparingly if a uniform stand is to be maintained. The last crop of alfalfa is frequently pastured off. Care should be taken not to pasture too closely. The evil effects of the trampling of the stock while grazing can be overcome by disking to loosen up the compacted ground.

All kinds of live stock may be pastured upon alfalfa. Horses and sheep are more destructive to the stand of alfalfa than are cattle, as they graze more closely. Hogs are apt to injure the stand by rooting unless their noses are ringed. The utilization of alfalfa for hog pasture is in the aggregate probably the most extensive, as nearly every farmer throughout the alfalfa regions makes a practice of this chiefly because it proves to be a very profitable method of utilizing the crop. An average field of alfalfa will support continuously during the growing season about ten large hogs to the acre and enable them to make good gains, especially if a small quantity of grain is fed in addition. The usual custom is to allow one pound of grain a day for every hundred pounds live weight of the hogs.

The principal drawback to the pasturing of cattle and sheep on alfalfa is their tendency to bloat. This danger can, however, be reduced to a minimum by proper precautions in not allowing the cattle to go on to the pasture with empty stomachs, especially when the alfalfa is wet.

When the animals become bloated several remedies are usually at hand for the malady. A large bit an inch in diameter may be tied in the mouth, a piece of rubber tubing may be passed through the mouth to the first stomach, or as a last resort the animal may be tapped to allow the escape of the gas. For this purpose a trochar is best, but in the absence of this instrument a small-bladed knife may be used to make the incision about 6 inches in front of and slightly below the left hip bone. A straw or quill may be used to permit the escape of the gas.

---

A request has been made of the regents of the state university to establish a model dairy at the state farm at Davis.

Staging in The Imperial Valley.

## PREPARATION OF LAND FOR CELERY.

IN the preparation of the land, the kind of soil and its fertility, the method of cultivation and irrigation to be followed, and the demands of the celery plant upon the soil, are some of the important points that must be considered. According to the experience of eastern celery growers a black mucky soil is considered one of the best, admitting at the same time that "a deep, rich loam will produce the best of celery." Celery is a crop that demands a rich nitrogenous soil as well as a uniform amount of moisture. This being the case, if our soils are not rich enough to produce a good celery plant they must be fertilized. As a rule very few soils are ever rich enough for celery. One of the best all around fertilizers is well rotted manure. Owing to the fact that the nitrogen in the manure is not available to the plant immediately after being applied to the land, it is necessary to apply the manure some time before the plants are transplanted. For best results the ground ought to be manured during the winter or early spring. Always manure early enough to give the manure time to become well incorporated in the soil. As soon as the manure is spread on the land it ought to be plowed under and irrigated and be kept moist all the time. It is also advisable to put a thin layer of well rotted manure or guano in the bottom of the furrow a week or two before transplanting the celery plants. The fertilizer in the furrow should be covered over deep enough so that the roots of the newly set out plants do not come in contact with it at first. After covering it should be irrigated.

Some growers prefer simply manuring the bottom of the furrows. In such cases a larger amount should be added than when the whole surface of the ground is manured and it should be put in two or three months before the plants are transplanted. The manure in the furrow must be covered over with about two or three inches of soil and kept moist. In addition to this it is advisable to use sodium nitrate along the row after the plants have started to growing.

The distance at which to make the rows will depend to some extent upon the fertility of the soil and the variety of celery to be grown. If the manuring of the furrows is the method to be followed, the furrows ought to be made about six to eight inches below the level of the surface. In plowing out these furrows it can be done in the same way that sweet potato ridges are made, leaving a deep center in the middle with a high border on each side. The plants may be transplanted about five or six inches in the row.—Fabian Garcia, New Mexico, Col. of Agr.

## WHY ARE STRAWBERRIES STRAWBERRIES.

Why strawberries are called strawberries is discussed in an Eastern exchange as follows:

If we will go back to the start, I doubt that strawberries ever had much runners or mulch, but I have seen the berries perched on the ends of straw-like stems from fourteen to sixteen inches long and the leaves also the same. When strawberries grew wild they were usually in tall wild grass in some low, rich, but sandy soil—what we call river bottom land in the middle states. The thick grass caused them to grow slim just the same as thick timber makes pines or oaks grow slim and tall. Out by themselves oaks will grow scarcely 40 feet high, but I used to know of them in Iowa between 1860 and 1870 that would square 10 inches and almost straight for 60 feet with scarcely a knot. These long stems of the strawberry were an advantage. It caused the plants to collect and store oxygen for a long time and in larger amount. Oxygen is the origin of acid and sugar—that is fruit sugar. The longer these stems were the better the berries tasted. It could be readily perceived by anyone. Sometimes there were strawberries growing on open ground and they had very short stems. Strawberries are not as sweet or large amongst tame grass as wild, because the tame grass robs them of oxygen more than the wild grass. The tame grass uses more oxygen because it develops more seed than wild grass.

## SELECTION OF LIMA BEANS.

From an address by M. E. Sherwin made some months ago before a farmers institute held at Oxnard, we quote the following on Seed Selection for Lima Beans:

The subject of lima beans is one of the greatest interest to the farmers of this county. So it is not necessary to narrate certain details as to planting, etc., but state a few of the facts concerning the selection of the seed.

It has been proven with various crops that by careful selection of seed the average yield may be gradually increased. If this is the case with other crops why not also the case with lima beans?

What farmers of Ventura county want is a lima bean seed that will mature earlier, that will grow in an alkali soil and that will bring a larger yield per acre. It is possible to get any one of these requirements but the problem before us now is to get a seed with all these properties.

During last year's crop ten thousand vines were set apart for experimentation along this line although seven thousand were not used. The results with the other three thousand were quite gratifying. The beans from each vine were put separate and weighed. This is simply to serve as an example to show how agriculturists get at these difficult problems and the time and energy spent on a single proposition like this. But from results from this year's experimentation it has been learned that it is possible to produce a bean seed which has the above named characteristics and it is but a matter of time before such seed will be in use in this county, thus insuring earlier maturity and a slight increase in yield per acre.

---

The reciprocal demurrage act is proving to work two ways in this, that the farmers are compelled to have their products, especially hay, removed from the car in the specified time, which is often the cause of material loss.

---

Only one combined harvester and thresher remains in the Exeter section, so much of the land being taken for fruit production.

# The Ornamental Garden

## WATERING THE LAWN AND THE GARDEN.

IN a country of rainless summers, which in its natural condition is a desert—as is the case with California,—the question of applying water to plant life that it may grow luxuriantly, is one that is but little understood. To have a bountiful supply at all times on tap, a good hose and nozzles and turn on the flow for a time according to the inclination or the memory of the irrigator is one method of supplying moisture to vegetation, the one, too, that is most generally practiced, a method that requires less thought and perhaps less labor—yet the least scientific and in most cases the most unsatisfactory to the party who pays the water and fertilizer bill. Because of this carelessness or incompetency, and soon, in political parlance, strained relations will exist between them to the detriment of the interests of both parties in the controversy—sometimes because of the ignorance of both parties—but most generally on the part of the owner of the place. As to how the difficulties should be overcome: Five gallons of water applied to a dry spot on a terrace in one minute would do no good whatever to grass; the same amount dripping from a hose during an hour would remedy the defect, and at this point we offer a suggestion to the gardener: If such conditions are found, let the water run slowly on such spots while at work on the place.

There are two serious defects in-

In a Redlands Garden.

less way of watering, at least fifty per cent more water is used than is necessary to get the best results from the time consumed and money spent in the operation. Plants should be syringed at least twice every week to keep the foliage free from dust, also to keep in check aphis or green fly and other predatory insects, but water thus applied is small in quantity and evaporates away in a very short time.

A lawn where the supply of moisture is not drawn upon by the roots of large trees, either growing thereon, or along the curb, if thoroughly watered once a week, along the coast where fogs prevail, and twice each week in the interior sections of the state, where neither fog or dew is found during the summer, is ample for the requirements of the grass. An additional watering in either case each week will be necessary if trees are present, providing however, that enough plant food has been applied to meet the necessities of the plants in making a good growth.

No one need hope to have a luxuriant lawn who is not liberal with fertilizer in some form—the commercial brand being the best, because free from weed seeds, no matter how much water is applied.

Level lawns are easily taken care of, the water remaining where it falls, but the terraced lawn in this country is the despair of the gardener who cares—if he is limited in time to its care. The sub-soil will dry out in places more rapidly than in others, the grass will suffer in consequence thereof, the owner will accuse the gardener, unjustly, with separably connected with excessive watering of lawns and flower beds.

One is that the roots of the plants are induced to grow near the surface of the soil because of warmth, and the other the dissolving and leaching away of the elements of fertility into sub-soil beyond the reach of shallow rooting plants as most are which we grown in lawn or flower beds.

Roses if thoroughly watered once in two weeks in coast sections, once a week in the interior parts of the state, are abundant during the flowering period, and but once in the two months of their resting period during the mid-summer months, if a good crop of bloom is wanted during the fall and winter months, while begonias, coleus, and that class of plants which luxuriate only during warm weather, must be bountifully supplied with both food and water. Semi-aquatic plants, to which class papyrus, elephants ears, bananas and ginger plants belong, should be so located that they may receive at least 12 inches of water every week from the middle of June to the first of November, and stable manure, the cleanings of the hennery, or in lieu of the latter, commercial fertilizer in liberal quantities, to insure fine tropical effects. In the interior sections of the state with a low relative humidity, the above named plants will not give satisfactory results, no matter how much water may be applied to the roots. Evaporation of moisture is so rapid that only drouth-resistant plants will flourish there.—Pacific Garden.

---

Keep the tree free of suckers.

# Practical Tools

To produce a level surface requires a keen plane; to make an exact mortise calls for a true-edged chisel; to bore a smooth hole you must have a clean-lipped bit in a steady brace; to saw a straight edge demands a perfect saw; and so on through the realm of practical work.

Tools that get out of order quickly are useless to the worker. Right here the value of

# KEEN KUTTER

Tools and Cutlery becomes supreme. Scientifically forged, shaped, tempered and finished, they not only do their work with absolute accuracy, but maintain their fine working qualities through thick and thin.

Thus the name Keen Kutter stands everywhere for the most practical tools for practical work. This is worth remembering when next you buy tools.

Keen Kutter Tools include Carpenter Tools of all kinds, Farm and Garden Tools. Also a full line of Scissors and Shears, Pocket-knives and Table Cutlery.

If not at your dealer's, write us.

SIMMONS HARDWARE CO. (Inc.), St. Louis and New York, U. S. A.

# Make Money on Eucalyptus

Growing eucalyptus is one of the most profitable industries in California today. Anybody can grow it without any culture or expense after the first year. Our seeds are selected and tested by our own expert of 20 years' local experience. A few acres of eucalyptus trees will produce an unfailing source of revenue to the owner, as the demand will always be greater than the supply.

This is the time to plant eucalyptus seed for best results.

**Special Packet Prices**

**1 pkt. Corynocalyx (Sugar Gum), 10c**

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 70, 71.

### DEEP CULTURE.

Our readers will find another excellent article on the first page of this week's Cultivator, which, as is often the case with these articles, is written by different individuals who are eminently qualified to speak on the subject in hand. Perhaps one of the most difficult problems confronting the farmer is that of managing the soil. Some years ago it was claimed by many farmers that with commercial fertilizer at hand, any soil could be made to produce wonderful crops. It cannot be denied that commercial fertilizers are of a great advantage and have been used to advantage in nearly all farm productions, but in more recent years the great importance of mechanical conditions of the soil, has become more appreciated and this point is especially emphasized in the leading article this week. The trend of the article is not to show that mechanical condition is the entire requirement, but that it is the first requirement. After that fertility added to the soil in the form of commercial fertilizer is in order.

To secure that mechanical condition, the addition of humus, the use of lime, deep cultivation and other factors are referred to as essential. Perhaps the two greatest factors are the humus and then the deep cultivation, which will admit the air to the soil and allow the minute forms of life essential to plant growth to have the best conditions that they may increase. One farmer who recently asked as to bettering his soil conditions, when it plainly required deeper and more thorough cultivation as at least one of the factors, complained that his work was largely contracted and his contractor was not supplied with horses of sufficient strength neither tools of capacity to give what he realized the soil needed. Such a condition of course cannot be overcome unless the farmer will secure proper tools and power. This means funds to command such appliances, but as Mrs. Sherman said in one of her articles recently, ready cash is one of the requirements of farming.

If the farmer is not able to command these, then by being careful even with indifferent tools, thorough tillage may be given though perhaps at greater expense and with greater test of the farmers ingenunity.

### BE CAREFUL.

On the citrus page this week may be seen quotation from a circular issued by Mr. Chas. D. Adams, manager of the Upland Citrus Association. That circular calls attention to the necessity for greater care in bringing oranges to the packing house, and adds that "For all loads delivered after the 20th of June, which come to the packing house without being covered, there shall be a penalty of a quarter of a cent a box to be charged to the account of the owner of the fruit." Such a penalty is most just and reasonable and is what the careless fruit grower is compelled to undergo, only it is not always so definite of perception. That is, when he carelessly picks and packs his fruit and receives indifferent returns, he proceeds to condemn the transportation company or the commission man. The Cultivator realizes that these agencies or some of their mehods, rather, are often worthy of most hearty condemnation, but that should not justify the grower in being careless in his own methods. Let the greatest care begin at home and save not only the quarter cent penalty an association may place on each box, but the greater penalty, which often is not so apparent, which comes from illy prepared fruit.

### BEAUTY AS A COMMERCIAL ASSET.

The great influx of visitors to California induced by the meeting of Elks in Los Angeles again emphasizes the commercial value of beautiful road ways, parks, and other attractions. California, especially the southern part of the state, has never been backward in its improvements, but there is opportunity, especially in the rural districts, for greater extension. It cannot be gainsaid that real value is given to property by attractive borders and parkings along the roadways. It has been remarked that a place does not produce any more for its greater beauty, but even that we would question. It is true that in themselves the attractive borders or parking do not cause the orange tree, the apple tree or the berry bush to produce more fruit, but the spirit of thrift which is manifested by cleaning up and beautifying the front of the place is likely to cause greater care and more intensive cultivation of the productive part of the place that it may be in keeping with the attractive outside. We are largely creatures of environment. Slovenly surroundings are liable to encourage slovenly ways of doing work. Likewise neatness and thrift encourage their kind, and our remark that we believe there is commercial worth in attractive surroundings and well kept property will almost invariably be made good. Of course, in addition to that is the fact that at such times as these we are judged perhaps by visitors whose impressions gain for us a reputation which is of commercial worth from the real estate standpoint.

---

It is reported that the investigating board appointed by former President Roosevelt to look into the matter of the effect of sulphur on fruit as a food for humans, will visit California during the present month. The mission will be to investigate the fruit drying process and possible methods of improving it. It is possible that Secretary Wilson may visit the state on the same mission.

### MECHANICAL CONDITION OF SOIL.

(Continued from Page 51.)

give undoubted benefits on account of the flocculation of the soil, we are still in doubt as to whether the land described does not need other fertilizing substances as well.

There is no doubt but what sugar factory lime is the best form in which lime can be used for application to the soil, not only because it is very cheap, but because it is very finely comminuted having been first milk of lime in the process of preparation for its use in the sugar factory. In addition, it also contains fertilizing elements which an analysis at the University Experiment Station demonstrated is of greater value than the first cost of the sugar factory lime to the user.

Above all, we believe that it is necessary to use cover crops, and, as suggested by some writers, the application of straw and strawy manure is especially desirable. One point not made we would emphasize, and that, is that it is necessary to put in a team or teams which are able to work this ground deeply, and in that way break up the plow sole or hard pan which may be forming under the present cultivation. Stiff soil demands heavy teams and strong tools.

* * * *

Another inquirer asks as to gypsum and its effect upon hardpan, especially for a soil that is rich and productive in a wet season, but at the same time affected with white and black alkali. If the season is very wet the hardpan seems to hold the water so that there is some drowning out of plants. This land is covered with alkali weeds twelve or fifteen inches high. Should they be plowed under?

Prof. Wickson has given the following advice:

**Prof. E. J. Wickson.**

Gypsum will not always help hardpan. It depends upon the nature and composition of the hardpan. It is sometimes too rich a lime already. Gypsum will turn black alkali into white, thus reducing its appetite somewhat but not getting rid of it. If he cannot irrigate, he should plow under as much winter growth of green stuff as he can and grow a summer crop for which (from what you say about drowning out) the soil may retain moisture enough. If he has water to irrigate and can afford to put in under-drains about three and a half feet deep and fifty feet apart, he can irrigate (or take care of rainfall) without danger of drowning out a crop, and his alkali will go out with the drainage and the hardpan will disappear also.

## Shop Talk

**VALUED FRIENDS.**—In remitting for a new subscriber Mr. M. B. Curtis of Mercedes, Texas, writes: "I also send herewith a list of names of possible subscribers to whom you might send sample copies. I think the Cultivator more nearly meets the needs of the people of this section than any other horticultural paper I know of. I think too that the readers here will find much of interest to them in the advertising columns of the Cultivator."

The last sentence in Mr. Curtis' letter is worthy of further attention, we think. Many readers look upon the space given to advertising as so much loss to them and consider only the half of the paper given to reading matter as of value. These same people often may find most attractive information in these advertisements, information as to improved machinery which gives their farms greater producing capacity and permits them to place their crops on the market at lower cost. The work of manufacturing is making great strides in advance every day. The agricultural class must appreciate that, and does in fact, but not to the extent we believe it should. A careful observation of the advertising columns of any class paper cannot help but keep posted and in the front rank those who are engaged in the particular business to whose interests the paper is devoted. To this rule the farmer is no exception. We certainly believe Mr. Curtis states a most self evident truth when he says: "Our readers will find much of interest to them in the advertising columns."

By the way, the spirit which Mr. Curtis shows in sending a list of names of possible subscribers to whom we may send sample copies, is worthy of being followed by a greater number of our friends. The Cultivator is bound to improve, but our friends may help it along that line by thus occasionally sending lists of names or speaking a good word for the paper in their neighborhoods.

# Agricultural Notes of the Pacific Coast

## Northern California

Petaluma has a new creamery recently established.

Most of Corning's apricot crop was shipped to Seattle this season.

A large number of Hindus are picking fruit in Biggs, Butte county.

The first shipment of Bartlett pears was on June 21st from Yuba City.

A plan is on foot to secure better drainage of lands near Live Oak, Sutter county.

The last planting of sugar beets in Yolo county for this season was near the end of June.

The Yolo County Live Stock and Race Meet will be held at Woodland, August 18th to 21st.

San Francisco sportsmen contemplate the establishment of a large trout farm near Haywards.

A surveying crew is running lines to locate the route of a canal along the Eel river in Humboldt county.

Canners report the hold-over stock on the coast as almost nothing, while the demand is good for this year's output.

Prof. Hopper of the University Farm at Davis has been investigating dairy conditions in Humboldt county.

A number of orchardists at Haywards contracted for their entire output of apricots for $22 and $25 per ton, orchard run.

Lincoln, Placer county, reports sufficient flow of water for a successful season. Wells recently sunk have proved good producers.

The cannery at Milpitas, Alameda county, was recently destroyed by fire and will cause much loss to growers who had expected to dispose of their products.

The Pacific Fruit Express Company will enlarge its capacity to handle California fruit by adding a million and a quarter dollars worth of rolling stock.

An exciting grass fire occurred in St. John, Glenn county, which burned over a vast amount of hay and grain and one stack containing over 150 tons of hay.

More land has been purchased by the Pittsburg syndicate which has been investing in lands in Glenn county and great improvements are anticipated.

A grain grower at Hamilton City, Glenn county, followed his sugar beet crop with wheat this year with the result that he averaged fifty-six and a quarter bushels per acre on 125 acres.

A Sacramento merchant has a letter from Mr. David Lubin in Rome who says that the reputation which California fruit has secured there is such that it is demanded by the best customers.

The large force of men working on the dam sixty miles from Orland is making progress and it is now said that the dam will be 190 feet high when completed and will require 13,000 yards of material.

The law passed by the last legislature changing the dates between which deer may be killed makes a two week's longer period than the former law. The season opens July 15th and extends to November 1st.

## Central California

Lindsay shipped eighty-two cars of oranges up to July 1st.

San Benito Valley claims to be the greatest hay center in the state.

Many grapes in Tulare county dropped badly on account of mildew.

The Pacific Sugar Corporation's Corcoran plant began operations July 8th.

A big grass fire did much damage in southwestern Tulare county last week.

The San Joaquin table grape growers are being offered $25 per ton for tokays.

All danger of high waters along the rivers of the San Joaquin Valley is now past.

Wooly aphis is reported to have been exceedingly bad in Kern county this season.

The State University is to issue a series of post card bulletins with instructions to farmers.

The fear of squirrels spreading bubonic plage is giving impetus to the campaign against them.

Some fields of wheat in Angiola, Tulare county, have been seriously affected with rust.

Greater precautions than ever have been taken in the forest reserves to protect from loss by fire.

Fruit trees in the neighborhood of Tehachapi are reported to be in exceptionally fine condition.

The effort to establish a grape juice factory at Hanford has been abandoned for this season.

Some fruit trees in the Poplar district, Tulare county, were injured by standing water at the time of flood last winter.

The U. S. Geological Survey has classified the lands of Kern county, separating the agricultural from the mineral lands.

Kings County shipped its first car of dried apricots from Armona June 26th. It was bought by the Armsby Co., at eight and a half cents.

Careful estimates by the leading citrus growers of Tulare county show that the output this season will be about sixty per cent of the normal.

All records of fish catches in Monterey Bay were broken recently when 7,000 salmon averaging 17 pounds each were the result of the day's catch.

Some physicians have warned against the use of cabbage which is affected with the brownish colored mold leaving small brown spots on the leaves.

The Kings county Chamber of Commerce has issued a small circular under the title of "Little Stories of Kings County Products" which contains most attractive matter.

The San Benito County hay growers are warehousing most of their crop owing to the buyers attempting to bear the market and making offers so low that the farmers refuse to accept them.

The holdings of the great Miller and Lux firm in real estate in the San Joaquin Valley and Nevada at one time aggregated 14,569,180 acres, or more than the kingdoms of Belgium and Denmark, and about two-thirds as large as Ireland.

## Southern California

Escondido, San Diego county, has a sunflower eighteen feet tall.

Planting of celery is in full swing in the Orange county peat lands.

The Ventura output of apricots will be exceptionally heavy this year.

Orange county apricot crop is the best in the past half dozen years.

Malaga grapes have already been shipped from Mecca and Coachella.

The last day of June showed the mercury recording 115 degrees at Imperial.

The Beaumont cherry crop has been marketed at exceptionally satisfactory figures.

One orchard in the Yucaipe Valley marketed 7,000 pounds of cherries daily in the season.

All oranges excepting Valencias are somewhat in the dumps and are closing the season in bad form.

Impeial hog raisers have secured big returns for stock this season, one grower netting $1,100 per car.

Southern California lemon growers are well satisfied with returns for lemons for the last few weeks.

Shipments of melons from the Imperial Valley are rapidly declining. Prices have been fairly satisfactory.

A celery grower near Wintersburg, Orange county, produced $900 clear on three acres of celery last year.

The new sugar factory at Santa Ana, Orange county, is said to be one of the most up-to-date factories in the state.

Two and three cars of potatoes are shipped daily from Anaheim. The growers are receiving about one dollar per sack.

The Secretary of the Interior has fixed upon 40 acres as the farm unit for the lands which will come under the irrigation waters from the Laguna dam.

The high water of the Colorado filled the lowlands across the Mexican line so that some back water flowing into the New river found its way to the Salton Sea.

The Highland Protective Fruit Association is the newest fruit organization in the state. The association proposes to erect a packing house and handle fruit of its members.

Riverside reports that the Department of Agriculture contemplates the placing of an expert in California to investigate as to the possibility of an improved strain of navel oranges.

Some Imperial hog raisers declare the discrimination by buyers against hogs raised in that valley is unjust and if maintained will reduce the number of hogs raised in that section.

Hemet apricot growers have been the busiest of men for the past few days, most of their fruit having been dried on the ground, though some of the fruit has been shipped to Colton canneries.

At the annual meeting of the Highland fruit growers' association, the election resulted as follows: President, J. L. Yarnell; vice-president John W. Corwin; secretary and general manager, L. S. Steele; directors, L. C. Waite, J. L. Yarnell, Mrs. James Fleming John W. Corwin, S. G. Lamb.

## The Coast

The first summer rains began in Arizona July 6th.

The State Horticultural Society of Oregon held its annual meeting at Salem July 8th and 9th.

Many potato growers near Spokane marketed their new potatoes this year in crates instead of in sacks.

The demonstration train now touring eastern Washington is being given immense audiences at every stop.

A cargo of 200,000 pounds of wool was recently shipped from Asotin, Washington, to scouring mills at Pendleton.

Plans are already being laid for larger planting of sugar beets near Glendale, Arizona, than in any past season.

The mustard pest has a more extensive growth in eastern Washington than usual and has reduced the output of many fields.

The creamery at Waitsburg, Washington, which has failed twice, has finally been put upon its feet and has made a successful run.

Many Spaniards employed on the sugar plantations of the Hawaiian Islands have been attracted to Mexico by offers of better treatment.

Whitman county, Washington, will produce 13,000,000 bushels of number one wheat this year, which is the biggest production ever in that county.

Nearly all green fruits from the section about Sacramento have been selling satisfactorily this season. About fifty cars have been going forward daily.

The recent session of the Washington legislature failed to make an appropriation for the horticultural board and the State Board will be without funds for one year.

Walnut growers near Pomeroy, Washington, are greatly extending the acreage of walnuts. This is caused largely by the profitable seasons for walnuts the last two years.

Oregon fruit growers will attend the national irrigation congress and are planning for a big feature in the parade. They will show the advancement made in irrigation in Oregon.

The Hawaiian Islands are considering the advisability of using ohia wood for railroad ties. The conclusions reached are that "on the whole this wood compares with the best red oak."

The superintendent of entomology of the Hawaiian Islands reports that during one month recently he inspected 32,738 parcels, one hundred and ten of which were fumigated, fifteen burned and five ordered returned.

At a recent meeting of the Feather River Flood Protective Association the matter of a survey from Oroville to the Ord Ranch and the matter of securing protection from the dredgers which are causing the overflow were discussed.

Mr. C. H. Rodgers, President of the Orchardists Association writes us that this season's yield of apples so far as can be judged at this early day will probably reach 4500 cars in the Pajaro Valley, i. e., there will probably be 3,000 cars packed for market and about 1,500 cars for canning, drying, cider, vinegar, etc.

**FOR MOULTING HENS**

**Feed**

# MIDLAND

## Poultry Food No. 4

***$1.95 per Sack***

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.

***Petaluma Incubators and Brooders***

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Send for our Illustrated Catalogue.

**Petaluma Incubator Company**

**Petaluma, California**

Our General Agents for Incubators and Brooders and Midland Poultry Food:

**Petaluma Incubator Co., Petaluma, Cal.**

**Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles**

**Berrar & Robertson, San Jose, Cal.**

**Feed for Eggs Next Fall by Starting In Now with**

# West Coast Egg Food

Don't make the common mistake of supposing that you can let the fowls get all run down before or during molting and then bring them up by heavy feeding later. You won't get eggs that way.

West Coast Egg Food has been the leader for many years. It is even better this season. We know how to make rightly balanced rations. That is our business. And we have the best equipped mill for doing it. No unsound grain, no mill refuse and such stuffs in ours.

Send for Biddy Booklet with many testimonials. Ask your neighbors, for there are more West Coast Poultry Foods fed in Southern California than all other kinds put together. If your dealer doesn't sell "West Coast" don't take others "just as good," but send to us and we will serve you right.

Made by the

**West Coast Mill**

# Profit in the Poultry Yard

By Mrs. Frank Metcalf

**We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.**

### MANAGEMENT VS. LUCK.

A KANSAS lady wrote the "agricultural editor" of a great political daily as follows: "Can you please tell me what ails my chickens? I hatched nearly three hundred this spring, and have only fourteen left. All the rest appeared to die of some strange disease." The editor replied: "This is an unfortunate state of affairs. Judging from the symptoms given by this lady, we are inclined to believe her chickens died of inability to live."

This was a good answer, and just such as I ought to give to many querists who give me about as much information as this lady gave the editor. For instance, a man writes: "The past three years I have hatched nearly a thousand chickens, and actually raised less than three hundred of them. I am going to try it again this year and if I have no better luck I am out of it for keeps. I know about twenty people who are in the same boat with me. We have poultry papers and books galore, and we have dropped hundreds of dollars into advertised stuff, but still go gaily on losing our chicks by the hundreds. Personally I am beginning to think this poultry business is a fake of the fakyist type. Can you give us any information that will help us any? Can you tell us why it is so hard to hatch chickens, and then so much harder to raise them?"

Notice how much information this party gives. He mentions one thing that gives a slight inkling of the cause of his non-success, and that is "luck." A man living not far from me hatched about four hundred chickens, and they were growing finely. He and his wife were smiling widely about their "good luck." One fine Sunday they drove to the home of a friend, about five miles distant, for a visit. While there, a storm of hail and rain exploded over that locality with scarcely any warning. Of course all the hens with their broods were some distance from the farm buildings, as also were the larger chicks. The family hurried home as soon as the storm was over, and, as they feared, found but very few chicks about the yards, but in the orchard and adjacent pasture and against the wire fence were plenty of them, cold and stiff. They lost nearly three hundred. The man said it was the "durndest streak of bad luck they had run against in a coon's age!"

A neighbor of theirs, who does not believe in luck, had more chickens than they had, and he did not lose one. They were enclosed in a yard 50 feet wide by 230 long, with their coops and a house and shed to get into, and there they went when the storm began. And, by the way, this man has some ideas of his own about raising chickens. He has two yards, 50x230 feet, side by side. They are fenced with wire fencing, with one-inch mesh netting 12 inches wide at the bottom. His house and shed are at one end of the yards and open into both. He raises his chicken crop in one yard and his garden vegetables in the other one year, then changes about the next. The chickens get all the vegetable tops and trimmings from the garden for greens, and they keep them pretty well cleaned up. He keeps two or three coops of the smallest ones in the garden to clean up the insects. When they begin to damage things they go into the other pen, and more freshly hatched ones are brought in. He always raises lots of chicks, and always has a good garden. But, as I said, he doesn't believe in "luck," but has great faith in management.

That thing, management, evidently is what my inquiring friend, and the other twenty he mentions, lack. The fellow that believes in "luck," strange compound, self-acting and self-managing hatching and raising machinery, and fowls and chickens that are wise enough to take care of themselves under all circumstances, is the chap that goes out of the poultry business. There are thousands of such, and they make things pleasanter for the parties who are sharp enough to believe in close attention and good management, because they leave the market to them.

Six years ago a fifteen-year-old boy wrote me that his father had given him the poultry, and half his time to take care of it, together with all the grain he needed. He said that people in his locality did not seem to have much luck with their chickens, but he meant to give it a try, anyway. I suggested the two yard system as being the simplest, and easiest managed, and told him to borrow money for his fencing, if he did not have it, and to go in and win. He borrowed the money from his father, put up his fences, made his coops, etc., and went at it in earnest, and stuck to it. He succeeded from the very start and astonished the natives. Four years afterward he went to a college to learn civil engineering, paying his way with the money he made from his poultry. He wrote me that he had enough to put him clear through. His neighbors said he was "naturally lucky" with chickens. But it was sensible management, that was all.—Commercial Poultry.

### IMPORTANCE OF SHADE.

While sunshine in wholesome quantities is good for chickens of all ages some provision must be made to supply shade in hot weather to prevent losses from sunstroke. Berry bushes supply admirable shade. Growing corn or other grain gives grateful shelter in hot, sunny weather. Canvas and board shelters should be supplied when stock cannot have shelter of bushes, shrubbery, trees or growing grain. An orchard makes an ideal summer run for growing chicks.

Canvas or awning cloth tents or shelters stretched over common slatted "A" coops afford excellent shelter in exposed locations and can be easily arranged. Even weeds may be made to serve for shelter from the hot sun. Whatever you do don't fail to provide shade of some sort.

When the chicks begin to show a disposition to go to roost at night provide open-front roosting coops made from packing boxes, piano boxes or supply the portable coops which

may be obtained of any poultry supply depot. Don't be afraid that roosting young will cause crooked breasts. Crooked breast bones are the result of faulty nutrition and insufficient mineral food and not of early roosting. Supply plenty of green food and an abundance of dry granulated raw bone (oyster shells also after the first month), and you need not fear crooked breasts. Proper food, green food and plenty of mineral food in shape of bone and shell will also prevent leg weakness.—Reliable Poultry Journal.

### INCUBATION OF LONG AGO.

The poultry business has long since identified itself with the rushing throng and forged ahead. What has been done? Let us look into the past. In Egypt we find people hatching eggs in the hot sand and barrel-like oven or steve. Thermometers are not used. The attendants endeavor to keep the heat a trifle greater than that of their own skin. Artificial incubation is said to be older than the Christian era. Eggs were hatched in countless numbers long before anything was recorded as to the existence of poultry itself, and while it does not seem worthy of consideration to quibble as to time and state of things that existed 4,000 years ago, at the same time it is not out of place to state that we are not even good imitators of artificial methods as applied by the early-day Egyptians, who managed ovens that would incubate thousands of eggs at a time, without thermometer or regulator. This mode of hatching continued for generations, and it is only in late years that the inventive mind of man saw a chance of great improvement, and he has kept at it until today we have before us almost a perfect incubator. What is the cause of this great interest manifested in poultry? The poultry press. We have the incubator about as near perfect as it can be made. Before long nearly all the poultry will be hatched by the incubator, as the old hen is too slow for this age. We must have chickens by the thousands instead of by the dozens. The business will not be overdone. It don't look that way now, with the prices of poultry and eggs growing better each year. The Chinese plan is considerably aided through the unusual strength and vitality of the fertility of the eggs, their small flocks of poultry that roam about their door yards being of unusually strong and vigorous quality. The constitutional strength of these flocks produces eggs that will respond more readily to these artificial methods than might perhaps the eggs from less vigorous stock. On the other hand, the indomitable perseverance and continued activity of the Chinamen for full twenty-four hours of the day, if necessary to attend to the work, leave no stone unturned for success.—Commercial Poultry.

### THINGS WORTH MEMORIZING.

Never compel a hen to lay in a nest that is filthy. It is a thing the hen detests above all things.

Get some bone for your hens some way. If you can't do anything better, take a bone, and hew the scraps off with a hatchet. I have seen men do that; but look out for your fingers if you try it.

If any disease gets among your birds, especially if it be contagious, better clean the whole brood out and begin over again. But before you get the new fowls, thoroughly fumigate and otherwise renovate the houses from ceiling to floor. You cannot be too careful about this.

Keep an eye out for insect pests. They will bite any time, but you can furnish dust, and you must if you will have healthy birds.

Your roosters will not lay any eggs. Now is the time to get rid of this superfluous stock. Even if they do lack a couple of pounds of coming up to standard weight, sell them. The laying stock cannot have too much room, and every rooster takes up more room than pullets, and amounts to nothing.

To successfully raise the best and most profitable fowl the farmer must plan and follow out a systematic course in breeding and raising his flock. Never breed from the entire flock, but select the choicest specimens, which must be carefully separated from the more or less defective birds, and from these alone, should the eggs for hatching be obtained.

A few tobacco stems or a little cheap tobacco placed in the nests for the sitting hens will help to keep the lice in check.

Upon receiving eggs for hatching from a distance, it is well to let them stand twenty-four hours before placing under a hen or in an incubator.

If at any time any bird in the breeding pen shows signs of disease, remove it at once. No ailing bird should be allowed in the breeding pen under any circumstances.

It is a waste of time, space and food to attempt to grow exhibition birds of merit from inferior stock. The very best will throw quite enough of the poorer quality.

Place the brood coops facing the south early in the season, so that the sun's rays will penetrate the interior of the coop. Sunshine is a disinfectant. Clean the floors of the coops daily and thoroughly clean and disinfect the entire interiors of the coops at least once a week.

**EGG FOOD**

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

# Bees and Their Care

By Henry E. Horn, Riverside

## HONEY CROP ESTIMATE.

THE present has been another of those seasons, all too numerous in the southwest, that start out with smiling promises for the honey makers, but keep them not. How green and strong of growth the sages looked the first of April, how full of nectar the first few advance blossoms, how balmy the air and genial of warmth the solar life giver. And the bees, trusting to promises, reared armies and armies of workers to house the gifts of nature when the time should come

Of course, nobody ever expects much else of April, but change and variety, meteorologically. And change and variety duly arrived. Towards its end, though, as usually, the weather became warm and settled. And then came far famed May. The first was a beautiful day. From the time the first faint halo of the approaching Day-God sharply silhouetted the dark hills against the eastern sky, until its last golden rays faded away in the west, it was all, almost too perfect for this troubled world. The second broke with a "high fog over the citrus belt" as the weather clerk charmingly puts it. It cleared away about 8 a.m. But after that "high fog" stayed with us till noon, and often later. And with fog and cloud, cold winds.

That lasted, excepting just four days, until the 29th. That day a belated, but nevertheless highly efficacious "norther" cleared the sky with a vengance. And on the 30th a "scorcher" registered 105 degrees in the shade. And so May 31st, and June 1st, and June 2nd.

It moderated after that, but the damage was done. The sage was burned up, and from green, the looks of the hills had changed into brown in just four days. Back east people having heard so much of California's wealth of wild flowers, somethimes wonder why we don't flood the country with honey ever so often. Well, the tolerably fair weather record given above may serve to let some light in on that subject. And it may serve another purpose. Many beekeepers must sell their honey as soon as it is off the hives. As a rule early prices are low; and that for the reason, so sellers are told, that here and there great crops are being secured.

Well, this year the southwest at any rate is not harvesting great crops of honey. This applies, of course to the spring yield only. and the natural pasturage, but as that is practically all there is it really means the season's returns.

The reports from the half dozen sage counties vary as to yield, from well nigh nothing in the worst places to about two-thirds of a crop in the best. This means the extracted or "strained" article. Comb will be less than that.

Imperial valley will probably again get an average amount of extracted alfalfa, so late personal letters inform the writer. And, by the way, average crops is all there ever need be expected from that valley hereafter. There is too much crowding now ever to repeat the phenomenal yields of past years any more.

Owens valley, that almost forgotten mountain pocket beyond the slanting shadows of Whitney, expects to secure about 125 tons of comb honey. The heavy body of their product forbids all extracting, so comb is all there is. For the sake of timely heading off a rush of "sooners," this bit of information about the Owens country might cause among the excitables, it may be added that the yield per colony is only about 60 pounds, and that the price never runs over ten cents. There are a few good locations there yet, though.

Figures of prices sent out by buyers vary more than seems rational. "Water white," that aristocrat among honeys, should never go at less than 6½ to 7 cents f. o. b., yet commission men will thoughtfully finger off the ashes of their cigars before they rush at you when you say six. New crop Imperial alfalfa (amber) goes by the car at 5 cents f. o. b. shipping point, and is easy worth every bit of it. Up north a car or two of amber was lately traded for at 4½ cents; but, then, that honey was old crop, some nearly three years old, and, of course, candied solid. Half a cent is about the usual deduction for candied honey, though the retail market bears but little prejudice against it on that account; indeed, most people prefer it in that state.—Henry E. Horn, Riverside.

## EASY THING TO CARE FOR BEES.

IT HAS been thoroughly demonstrated that bees do play an important part in pollenating fruit-blossoms, also in pollenating cucumber blossoms, and clover and buckwheat. It is apparent that the fruit grower, if no bees are kept within half a mile of his place, ought to keep a few for himself, writes E. R. Root, editor Gleanings in Bee Culture.

But he may object, on the ground that he is afraid of them; that they are always stinging everybody and everything on sight. This is a mistake.

When properly handled, bees are usually tractable. As a general thing they will mind their own business much better than poultry or other farm stock when left to themselves.

But Mr. Fruitgrower will say that he cannot afford to waste any time in handling swarms.

## WATER FOR THE BEES.

Give the bees plenty of water. They need a great deal in the hot, dry days of summer, and will fly a long distance to get it.

If there is no running stream or lake of pure water near, it is well to place a pail of fresh water near the apiary every day.

Some genius has figured out that a bee will, on a busy day, draw sugar from 120,000 different clover heads.

---

The reclamation service paid $25,000 for the reservoir system near Orland, and it will be part of the big Orland system.

## POULTRY AND BEES.

There are few inquiries that come to the experienced bee-keeper more frequently than this: "What other occupation can one combine profitably with that of bee-keeping?" While the concentration of effort is wise in all our plans, work, and efforts, and while the specialist is most likely to make a shining success of his work, yet in case of bee-keeping, with its numerous off-years, it is wise to find some supplemental pursuit that will enable one to keep the pocketbook occupied in these same off-years. Is not poultry culture the one best suited to this need of all our rural pursuits? If one has a special leaning toward fruit-growing, then that may well be considered; but poultry culture is interesting, profitable, and there is always sure to be a demand for the product of the chicken-fancier. The same habits of punctuality, alertness, push, that make the successful bee-keeper are just what are demanded to win success in the care and management of poultry. I have been successful with both bees and poultry, and I am persuaded that no other line of work will prove better suited to the average bee-keeper than the care of poultry.—Prof. Cook in Gleanings in Bee Culture.

## DOCTOR DISCUSSES RATTLESNAKE BITE.

Declaring that there is no absolute antidote thus far discovered for the bite of a rattlesnake, and upsetting many of the popular superstitions regarding the American reptile, Dr. John Marshall, professor of chemistry and toxicology of the University of Pennsylvania, spoke last week before a group of physicians, says the New York World.

The lecture was the result of observations obtained by Dr. Marshall in five years of research.

"There is no antidote for the bite of a rattlesnake" declared Dr. Marshall. "The popular methods of treatment are all wrong and do no good."

"A very small percentage of adults die from rattlesnake bites. That is because the snake cannot inject sufficient poison to cause death . But most persons, when bitten, become badly frightened, and the whiskey may act as a stimulant and thus keep the victim from dying of fright. But where the poison is sufficient to cause death the whiskey cannot retard its work."

"Another popular cure for a snake-bite, the application of permanganate of potash, does no good. It is true that it will decompose the venom in the immediate vicinity of the wound, but it does not follow the poison into the circulation. If it did, it would cause death itself, because it will decompose the blood as well as snake poison."

"Caustic is used in many cases, or the wound is seared with a red-hot iron. The only result obtained is the infliction of a terrible wound, while the progress of the poison is not stayed."

"There is a blood serum which is successful when used. It is obtained in the usual way. A horse is inoculated with the venom and the serum obtained from its blood. This serum will check the poison, if used, but what man carries with him into the haunts of the rattlesnake a quantity of serum and an antiseptic hypodermic syringe for its use?"

"The treatment which is the nearest to nature is the one that is most efficacious. Cut open the wound caused by the fangs and then suck it until all of the poison is extracted."

# General Agriculture

## SPRAYING FOR WEEDS.

THE eradication of weeds by other than cultural methods has been a subject of study at a number of the agricultural experiment stations and elsewhere. This has resulted in the discovery that various chemicals through their corrosive or other action will destroy many kinds of weeds. As long ago as 1895 it was shown by the Vermont Station that the orange hawkweed, a pest in lawns and pastures, could be controlled by sowing salt over the lawns at the rate of about 3,000 pounds per acre without injury to the grass. Lime, salt, arsenite of soda, gasoline, kerosene, crude carbolic acid, and copper sulphate have all been recommended for destroying weeds in drives, walks, tennis courts, and other places where it is desired to keep down all plant growth. Where cultivated plants are grown, thorough tillage can be relied upon to keep down weeds, but the serious problem of eradicating weeds in grain fields, pastures, and large lawns is the one to which present consideration is given. For this purpose, whatever materials are used they must not be seriously injurious to the grain crop or the grass, yet they must be sufficiently destructive of weeds to make their use economically practicable.

In parts of the grain-producing States of the Northwest, wild mustard, or charlock, and wild radish have become especially troublesome, the wild mustard particularly so. This weed is very common in wheat, oat, flax, and other grain fields from Wisconsin to the Dakotas and adjoining States, and it not only crowds out more valuable plants, but it may become positively injurious through its abundance. Like many others of our most troublesome species, the wild mustard is of European origin, and for many years spraying with corrosive chemicals has been practiced in the warfare against the pest in Europe. Copper sulphate (blue vitriol) and iron sulphate (green vitriol or copperas) are the substances most used. Both are efficient in destroying the wild mustard, the principal difference being in their relative cost. The blue vitriol costs more per pound, but does not require as strong a solution as is necessary of iron sulphate or copperas. There is now on the market a granular form of iron sulphate that can be secured for about $10 or $12 per ton, or even less when bought in large quantities. This is applied in the form of a solution, about 100 pounds of copperas being dissolved in 50 gallons of water. At this rate it makes about a 20 per cent solution, and 50 gallons is sufficient for spraying 1 acre, if properly applied. For its application a good spraying machine is required, and if a considerable area is to be treated one of the better power sprayers that deliver the solution with considerable force should be used. For small areas, hand or knapsack sprayers may be employed.

The directions given by the Wisconsin Station for spraying oat fields with a solution of iron sulphate for the eradication of wild mustard will apply to the treatment of almost any grain or grass field.

The spraying should be done on a calm, bright day, after the dew has disappeared, as the work is more effective if the solution is put on in the warm sunlight. When rain follows the spraying within a few hours the extermination of the mustard will not be complete.

The grain fields should be sprayed when the mustard plants are in the third leaf, or before the plants are in blossom, in order to have the spray do the most effective work. The day following the spraying the tips of the blades of grain may be somewhat blackened, but no detrimental effects can be noticed, either to the crop or grasses seeded with it, two weeks after spraying.

Daisies, cocklebur, bindweed, ragweed, chicory, sheep sorrel, yellow dock, wild lettuce, and many other weeds were partially or wholly eradicated from the fields where tests were made for the extermination of mustard.

In addition to the charlock, or wild mustard, and those mentioned above, other weeds are destroyed by the spray without injury to the crop, among them, according to the reports from the North Dakota Station, being the very troublesome Canada thistle.

The explanation of the action of the chemicals seems to be about as follows: The chemical, which is corrosive, attacks the young and tender tissues of the rapidly growing weeds, causing their destruction, while there is little if any injury to the grain crop, particularly if it is a winter grain or one that was sown early in the spring, so that the crop has gained considerable growth before the spraying.

Investigations at the North Dakota Station with chemical means for the control of weed pests have shown that in addition to weeds in fields, such persistent weeds as dandelions may be eradicated in lawns, parks, and meadows by thorough spraying with the iron sulphate solution without any injury to the lawn or pasture grass. In the region about Fargo, where the experiments were conducted, spraying once a month or every six weeks throughout the year was found to keep the dandelion in check. For spraying lawns the application should be made a few days after the grass has been cut, with a solution of about two pounds of iron sulphate to a gallon of water. The spray should be forcibly applied, not merely sprinkled over the weeds, on a bright sunshiny day, and the lawn should not be mown for two or three days after the spraying. Heavy rains soon after the spraying will destroy the weed-killing power of the solution. Wherever chemicals are used for weed eradication on lawns it will be found advisable to scatter grass seed over the lawn each spring and fall.

In many regions alfalfa and clover fields are infested with dodder, a parasitic plant that may be recognized by its yellow, thread-like stems which entwine the plants. Hiltner says that dodder may be destroyed by spraying infested areas with an 18 to 20 per cent solution of iron sulphate. The immediate effect of the chemical is to blacken the clover or alfalfa, but after a short time the crop recovers and is as vigorous as ever, while the dodder has been completely destroyed. In South Africa, spraying alfalfa with sodium arsenite at the rate of one-half pound to five gallons of water when well applied was found to destroy dodder with little injury to the alfalfa.

### Effect of Beets on Soil.

Is the growing of sugar beets detrimental to the land for the growing of orchards later on?

Would the growing of sugar beets between the rows of young trees be detrimental to them provided there was sufficient moisture provided for the trees?

Where can the material for inoculating alfalfa with the nitrogen gathering bacteria be secured? And would you advise putting it on alfalfa sown in the fall of the year?—W. W. C., Los Angeles.

The growing of sugar beets on land intended for orchards might even be of advantage. Of course, it cannot be gainsaid that any crop takes to a certain extent from the soil, but beets have proven a remarkably fine rotator when used with grains or other surface feeding crops. In any case the cultivation required by beets and the depth to which they go for much of their nourishment would have an advantageous effect on any crops which might be planted later.

As to planting between orchard trees, if the trees are young, we would not hesitate; if, as the querist says, the trees are supplied with sufficient moisture. It might possibly be necessary later to restore to the soil other elements, especially potash, which the beets have taken up, but we doubt not the return from the beets would far more than cover this expense. Outside of returning to the soil the elements used by the beets, we would say decidedly that clean and thorough culture of beets and removal of crops is better for the soil than the plan followed by some of leaving it to care for itself some little distance from the trees.

Material for inoculating alfalfa may be obtained from a neighbor's field which has grown alfalfa successfully for a period of years, i. e., if he will permit a load, or at least a quantity of soil to be taken from his alfalfa fields. This will carry bacteria enough to the new ground, if scattered broadcast over it and harrowed in, to answer all practical purposes. However, the seed men advertising in the Cultivator can supply you with a condensed form which may be handled according to directions and the seed inoculated before drilling.

### Houseflies.

Can you tell me of a repellant which will prevent house flies from collecting under porch and around doors and windows?—C. H. B., Petaluma.

We do not believe there is any repellant which would not be offensive to humans which could be used around the door very effectively. The best method is to see that in the construction of the porch there is left a chance for a free sweep of wind so as to leave no corners protected for the flies to gather in. A porch in the ell which has two protected sides so that the wind does not get in is sure to gather flies, and the minute the screen door is pushed open, they swoop into the house in swarms. It is possible that the scattering of buhach on door and window frames might make it so offensive that they would stay away for a while. At any rate it might be well to invest a dime in trying this remedy.

Another point which must be considered is the condition of the vault and stables where the flies breed. If these could be thoroughly cleaned and kept disinfected, fewer flies would be bred to cause so much inconvenience. The present campaign against these pests has shown the common housefly to be the medium of spreading infection of various diseases and to be one of the vilest of the pests which affect the household. It is not only a question of inconvenience as it has always been considered, but it is such a spreader of disease that not only every effort should be made to prevent it from entering the house, but it should be wiped out of existence. Manure from the stables should be spread and put under the ground as soon as possible. If left in piles about the stables it proves a perfect breeding place. The vault of the out-house should also be given care, and dry dust, air-slacked lime or other materials of the kind should be used most liberally.

### Reservoir.

Will you kindly state the size of a reservoir required to irrigate two acres of land two inches deep at one filling; also the thickness of the walls and amount of cement required to make a concrete wall for a reservoir of above size. Is there any advantage in building a round reservoir rather than one rectangular in shape?—Subscriber, Beaumont.

As there are 43,560 square feet in an acre and the inquirer wishes to irrigate two acres two inches deep with one filling, it would require a reservoir with a capacity of 14,520 cubic feet. A circular reservoir of this capacity if made eight feet deep, should have a diameter of 48 feet; if made six feet deep, it should be 55 feet in diameter. There is no particular advantage in making it circular, and if the land is high priced, it might be better to put in a square reservoir which would fit into the corner of the place and occupy somewhat less land. A square reservoir of this capacity six feet deep should be 50 feet square. If the convenience of the owner calls for a long narrow construction, he can easily determine the proper dimensions which will give a capacity of 14,520 cubic feet.

The walls to be perfectly safe should have at the bottom a thickness of four-tenths the height, i. e., for a wall six feet high, the width should be about two feet and a half at the base and taper to the top. Any mason can estimate the number of sacks of cement required for a wall of the shape and size determined on.

### Irrigation Laws.

Where can I secure California irrigation laws?—Subscriber, Gardena.

California has no complete irrigation law. The laws upon which most of our irrigation rights depend are scattered through the political code. One of the crying needs of the state is that these should be gathered together and a more consistent law enacted.

### Naming Grass.

I found a bunch of grass like the enclosed in my orchard. It seems to be well filled with seed. Is it possible that it is a forage grass?—A. L. C., Kingsburg.

This inquiry was referred to the State University and Prof. H. M. Hall answers:

"This is the darnel (lolium temulentum), a European weed which is becoming too common in California although it will probably never become a serious pest. It is poisonous, at least in certain stages, and is known as poison darnel. Fortunately it seldom occupies the ground to the exclusion of other grasses and so gives no trouble on this account. As a forage plant it is undesirable (aside from its poisonous properties); the related Italian ray-grass (lolium perenne var. italicum) may well replace it for this purpose. The darnel is usually found as a weed in orchards or waste places; the ray-grass as a forage plant in meadows and on low ground."

### Potatoes from Seed.

Will you please tell me about potato seeds? I do not mean seed potatoes. Do they look like tomato seeds? How long does it take for them to germinate? If I should plant the seeds in October in a frostless locality, would they grow so I would have the seed potaoes ready to plant the following spring?

I expect to have some seed sent me

by mail from Ireland and am anxious to learn the proper way to handle them. As I am very ignorant on the subject, will be very grateful for your information.—M. B. R., Los Angeles.

Growing potato seedlings is one piece of garden work I have never done and must pass this query to some one else.

On general principles I think you would fail by trying to start them on the approach of winter even in the best of California climate. February would be better. And if they grew for you it would likely require the entire summer to produce the tubers. You, of course, understand that you would have a great variety of types from even a single seed ball, and probably not one like the potato upon which the seed grew. It would be interesting work but not profitable.—O. A. L.

* * *

On this point the Cyclopedia of American Agriculture says: "Practically all the new varieties of potatoes, however, are produced from seed, for every seedling is likely to be different from the parent. Seedballs are not produced abundantly on most varieties. If it is desired to produce new kinds, the seed should be saved and treated as tomato seed is treated, being planted the following spring. The first year the plants are small and slender, and the tubers will also be very small. These tubers are saved and planted the next year, when a crop of good-sized tubers may be expected, showing their characteristics. If it is desired to combine features of two varieties, the flowers may be crossed; and the resulting seed will produce hybrids.

### Fertilizer-Stimulant.

I have a ten-acre lemon orchard in a most thriving condition, the soil of which runs mostly to heavy adobe. I have been putting in cover crops of burr clover regularly, which has been of undoubted benefit, also have used commercial fertilizers quite liberally. Now what I wish particularly to know is, would gypsum be more valuable to me under my soil conditions than a commercial fertilizer? I could buy twenty tons of the former at the same cost as five tons of the latter. Would two tons of gypsum to the acre be sufficient under ordinary circumstances? In other words, would the gypsum fill the same requirements as the commercial fertilizer so that a fair comparison could be made? Some writers contend that a commercial fertilizer is merely a "stimulant" to citrus trees and in the end causes positive injury. Is this at all true?—C. R. L., Lemon Grove.

Just what writers may mean as to plant "stimulants" it is hard to conjecture. The word stimulant usually refers to a substance which produces effect upon a nervous system, and as a rule it is conceded that vegetable life has no nervous system. However, we realize that the word when used with regard to plants refers more to increased and accelerated growth. This is brought about in plants by giving to them the elements which they need in the soil and by giving proper mechanical condition to the soil. Bear in mind that the mechanical condition of the soil has perhaps more to do with the health of plants than the actual chemical condition. The application of commercial fertilizer to the roots of the tree, if the soil is lacking in the elements so supplied, can only be beneficial if applied in the right way, in the right quantity, and at the right time. How any writer can maintain that the application of plant food is a positive injury, is a conundrum.

As to comparison of gypsum and fertilizer, that is very hard to make, because they are in no sense alike. Fertilizers are a plant food, and gypsum is not. Gypsum aids in bettering soil conditions, sometimes by liberating plant foods which already are in the soil, especially potash. Where the soil is deficient in available potash, the addition of gypsum will bring about a marked improvement, so that the plant may show material "stimulation" as a result of applying it, when, as a matter of fact, the gypsum contains absolutely no fertility. So while the inquirer, as he says, could buy twenty tons of gypsum for the price of five tons of fertilizer—and he can even do better than that—the gypsum would not take the place of the fertilizer. With the heavy soil in question, we would by all means continue the annual green manure crop, and if necessary apply commercial fertilizer. Let the green crop be plowed in early before it becomes too hard and cover it in thoroughly. An examination of the sub-soil also would determine conditions there that might give a hint as to treatment required. It is possible there may be hardpan. This question is more fully discussed in the leader article this week, and in another article on hardpan conditions which will appear in next week's issue of the Cultivator.

### Farm Plans.

I would like to see discussed in your columns plans for handling acreage to the best advantage, say a farm of twenty acres or even ten. Many farmers are without ideas in regard to the handling of their places, and I think such a discussion in your paper would be of great value to them. Of course I realize that it is difficult to make concrete statements in regard to a subject of this kind, as it is more a question of personal likes or adaptability of each farmer, but this discussion might give ideas and hints that would be most helpful. I have ten acres of alfalfa planted this spring, five acres of Muir and Lovell peaches, a good family orchard, one-half acre of grapes of different varieties, and one acre of land which can be planted to kaffir corn or other feed. I confess I cannot see how much can be made from this place. This perhaps may be from ignorance of procedure.—W. H. F., Denair.

It is possible there is a very good suggestion in the above, but unfortunately California is a state of specialists, that is, in many of the valleys of Southern California, the orchardist will not only settle upon citrus fruits as his entire industry, but will center upon oranges, or possibly upon one variety of oranges, because soil, climate and water conditions favor that particular planting. In another section, for example in part of Orange county, the grower will give his entire acreage to the cultivation of celery. In many sections of the San Joaquin Valley, dairying and alfalfa occupy most of the land, while but a short distance away raisin vineyards may be the specialty.

Notwithstanding these drawbacks to the suggestion of our Denair subscriber, it is probable that some very helpful hints may be brought out. Now then, considering the place of the inquirer. Ten acres of alfalfa surely is going to bring in a fine income. This will be greater of course if he has a number of dairy cows to consume his own product on the place. The five acres of peaches would perhaps have been better planted to clings, in part at least. The canners as a rule prefer the clings, and these if planted would have given slightly more leeway in the disposal of crops. However, local conditions must guide in the determination of this question, and perhaps Muirs and Lovells will lead to better results. The family orchard is a necessity that, we regret to say, many orchardists have neglected and so deprive their families of fresh luscious fruits of their own growing. Excepting for private use, we believe the half acre of grapes should have been planted to one variety. A half acre of grapes in different varieties is so fine a division that we can see no advantage in it unless they be of fine table varieties and the local market is looked to to dispose of them. With the dairy referred to, the acre that can be used for kaffir corn or soiling crops should be one of the most profitable acres on the place. Instead of devoting the entire acre to kaffir corn, it is possible that mangels or pumpkins might make a good variety for the cows. Of course if cows are not kept, then the acre should be devoted to berries or small fruits providing water is plentiful and a market can be secured for the crop.

The suggestion of our subscriber has much merit in it. Let our readers who have succeeded with their places in a variety of fruit products send us suggestions as to their method. It will be very helpful to other subscribers who may be similarly situated.

### Garlic from Seed.

Some time ago I asked advice as to the raising of garlic. Mr. Loblngier replied that "garlic can only be multiplied by planting cloves." I send you one of many plants which

### GRIGGSBY'S STATION.

Pa's got his patent right, and rich as all creation,
But where's the peace and comfort that we all had before?
Let's go a-visitin' back to Griggsby's Station—
Back where we ust to be so happy an' so pore!

The likes of us a-livin' here! It's jest a mortal pity
To see us in this great big house, with carpets on the stairs,
And the pump right in the kitchen! And the city! city! city!
And nothin' but the city all around us ever'-wheres!

Climb clear above the roof and look from the steeple,
And never see a robin nor a beech or ellum tree!
And right here, in earshot of at least a thousan' people,
And none that neighbors with us, or we want to go and see!

Let's go a-visitin' back to Griggsby's Station—
Back where the latch string's a-hangin' from the door,
And ever' neighbor round the place is dear as a relation—
Back where we used to be so happy and so pore!

I want to see the Wiggenses, the whole kit-and-bilin',
A-drivin' up from Shaller's Ford to stay the Sunday through;
And I want to see 'em hitchin' at their son-in-law's and pilin'
Out there at Lizy Ellen's, like they ust to do!

I want to see the piece-quilts the Jones girls is makin',
And I want to pester Laury 'bout their freckled hired hand,
And joke her 'bout the widower she come purt' nigh a-takin,
Till her pap got his pension 'lowed in time to save his land.

Let's go a-visitin' back to Griggsby's Station—
Back where they's nothin' aggervatin' any more,
Shet away safe in the woods around the old location,
Back where we ust to be so happy and so pore!

I want to see Marindy and he'p her with her sewin',
And hear her talk so lovin' of her man dat's dead and gone,
And stand up with Emanuel to show me how he's growin',
And smile as I have saw her 'fore she put her mournin' on.

And I want to see the Samples, on the old lower eighty,
Where John, our eldest boy, he was tuk and buried—for
His own sake and Katy's—and I want to cry with Katy
As she reads all his letters over, writ from the war.

What's in all this grand life and high station,
And nary pink nor hollyhock a-bloomin' at the door?
Let's go a-visitin' back to Griggsby's Station—
Back where we ust to be so happy and so pore!

—James Whitcomb Riley.

### A SHARK STORY.

SHARKS, as nearly every landsman knows, are the mortal enemies of sailors. A gale, a hurricane or even a cyclone are accepted by the deep-water men with almost stolid indifference. Their proximity to a ship, even to this day, is always looked upon as an omen of ill luck of some character. So when the cook of the old clipper ship William Prows, which I was commanding 'way back during the early '60s, pointed astern and scowled, and I saw the triangular fin of a huge man-eating shark protruding above the surface of the sea, I must confess to a feeling of uneasiness.

Soon I saw the men "forrid" leauing over the rail at the waist and peering at the wake of the ship. Presently they broke into small groups and fell to discussing the appearance of their dreaded foe.

I was then in the East Indian trade, running between Liverpool and Bombay. We were carrying about twenty passengers home, some of whom were returning from the Abyssinian War, which was then about closing.

The Prows had rounded the Cape of Good Hope in splendid shape and was headed up the east coast of Africa under a heavy spread of canvas in comparatively light breezes when the ominous sign stirred the ship's company.

From the occasional glimpses I got of the shark's flukes and snout I made him out to be a monster of the man-eating species, not less than eighteen feet in length.

I was naturally annoyed at the appearance of our arch enemy, that cast a gloom over an otherwise delightful passage up to that point.

"Shy something at the brute," I shouted to the cabin boy.

The lad picked up a canvas-back steamer chair which an old lady passenger had been using on deck, and hove it in the direction of the shark. After swearing at the boy a few moments for selecting such a missile, I walked to the taffail to see if it had been effective, but the chair was nowhere in sight. Well, that stumped me, as I concluded the shark must surely have swallowed it.

We had some oranges in the cargo, and, thinking that our unwelcome visitor might be satisfied with a mess of such delicacies, ordered a couple of the foremost hands to bring out a box of the fruit from 'tween decks and heave it overboard. To my surprise, the oranges, box and all, disappeared as rapidly as had the chair.

Then, to make the situation more distressing, other fins began to appear in the locality, and soon there was a regular procession of them astern.

Passengers and crew were visibly affected by the incident, and I was at my wits' ends for a method of ridding us of the trailing devils.

The old lady who owned the chair which had disappeared made matters worse by setting up a dreadful clamor for her lost property, and going among the sailors, catechising them for not "shooing the critters away."

She had not been popular with the men from the beginning of the passage, and at no time do they take kindly to the presence of a woman on board ship. Our female passenger's appearance was against her, too, for she was old and weazened, and I thought at times a little daffy. It was not long before rumors reached me that the men "forrid" were referring to her as a witch, and I went below that night with serious misgivings.

At daylight the following morning the cabin boy aroused me with the statement that the old lady was not to be found on board. I went on deck and my first glance was directed astern. The grim parade was still keeping along in our wake.

I had the ship searched from stem to stern, on deck and below, but the

old lady had sure enough sunk out of sight. The members of the crew acted in a very surly manner and I began to suspect that the old lady might have been urged by them to follow the chair and the oranges, for there is no telling to what lengths superstition may carry a sailor. I failed to get much information from them by either threats of keel-hauling or promises of an extra allowance of grog, so turned my attention to the sharks again.

I ordered the big shark hook on deck, and, attaching a line, soon had it trailing astern with a big chunk of pork for bait. Luck was with us and we had not been fishing long when the ho'sun shouted that we had hooked the big fellow.

A tackle was rigged from the main yard, and it did not take long to haul him on board. I ordered a "forrid" and told the men to cut him open and see if there were any signs of the missing passenger in his belly.

Actually dreading that there might be, I went below to await a report. Presently the mate came dashing down the cabin companionway and yelled excitedly:

"What do you think was in that shark's belly, sir?"

"I don't know," I replied in a subdued tone, afraid almost to hear.

"Why, the old woman is a-sittin' there in her old chair a-tryin' to sell oranges to the passengers at a shillin' apiece."

I was greatly relieved, for I knew my mate was a truthful man.—Post-Dispatch.

# About the House

NICE summer stockings should be filled with crumpled tissue paper and hung where the air can blow through them after each wearing. You can clean lace and fine silk stockings by putting them through a bath of naphtha, but the only safe place to do this is out of doors. When they seem clean rinse in clean naphtha and hang in the open air. There is nothing nicer than mending tissue for repairing stockings of silk or lisle thread.

The economical girl launders her own stockings, for they soon fade and their beauty is gone if they are put in the general wash. Stockings will wear much longer if laundered frequently than if allowed to dry moist with perspiration, and if they are only slightly soiled it takes but a few minutes to make them clean and soft again.

Nice stockings of any color can be kept soft without fear of fading, by stirring enough pearline in warm soft water to make a nice lather, and then putting the stockings in and allowing them to remain for ten minutes, then rubbing with the hands.

White stockings are improved by soaking in the suds, but colored stockings must be washed, rinsed, and dried as quickly as possible. When they seem clean rinse through a very light suds and then through clean water. Pull the stockings into perfect shape before they are hung over the line, and before they are quite dry. Press them on the wrong side with moderately hot irons. Some people object to the ironing, but they are much softer and more comfortable to wear if the feet are pressed out smooth.

When childrens' white stockings have become very soiled, a little coal oil should be added to the suds for washing them, and they should be allowed to soak in this suds for an hour before washing them out. If any holes are found in the stockings darn neatly with silk finished cotton. Be careful to run the thread so far on each side of the hole that it will not fray and pull out the goods.—M. E.

### OUR MANLY TRAINING OF GIRLS.

Our training of girls approaches close to the idiotic, claims Katharine Eggleston in Woman's Home Companion for June. The average girl, from the minute she leaves her dolls to go to kindergarten, till she matriculates at college, is told about men and men's work—never about women. The kindergarten songs and tales are about Lincoln and Washington—and even the pictures of animals show the lion and forget the lioness. In older childhood she is taught to build sand forts instead of good old-fashioned mud pies, and even the sums in arithmetic dwell on "Billy's" marbles and "John's" apples, to the total neglect of his sister.

Later still she goes to high school and learns history with all its ideals of brave men—and here again the woman's share of quiet courage is completely overshadowed. She learns carpentering, although she cannot cook an egg or sew a seam. And finally, her education finished, she knows all about the higher mathematics and is short-changed by the butcher. She learns political economy, but doesn't know who are the members of her own school board. Miss Eggleston's bright article concludes:

"If your boy wanted to be a lawyer, and a neighbor told you to put him to work in a carpenter's shop by way of preparation, you would think your neighbor crazy. But you do not consider yourself crazy when you train your daughter, who is to be a wife and mother (and nothing can get away from the grim statistics that women do marry, despite economic independence, the higher education and all other arguments in favor of coeducation), precisely as you train your son, who will enter some profession or trade, there to first earn his own living, and then to provide for a family yet unborn. The one to bear the family and to rear it, the other to provide shelter and comfort for the mother of that family, and yet both trained precisely in the same way."

### WASHING BLANKETS.

Blankets should not be rubbed, and soap should never be rubbed on them. The best way of dealing with them is to have a good tubful of warm water, just warm enough to feel pleasant to the hands, and make it into a good lather by melting in it a cupful of soap jelly made without soda.

Put the blanket in this and let it soak a few minutes, while a second tub, exactly like the first, is prepared. Move the blanket up and down in the suds and squeeze and press it against the sides; then put it in the second tub and place another blanket to soak in the first tub.

Squeeze the blanket in the second water and when it looks clean rinse in clear warm water being careful to get the soap well out. Each lather will probably serve for two or three blankets, but it is most important that the water should be clean.

The good color of blankets depends very much on the cleanliness of the water in which they are washed. On no account wring the blankets tightly; to do so would spoil the nap.—Ex.

**Polytechnic Business College**

**304 12th St., Oakland, Cal.**

(Inc.) Capital Stock, $100,000.00

**The Great Business Training School of the West**

- Over 1000 students attending this year.
- Finest building and equipment in the U. S.
- National reputation for high grade work.
- Indorsed by Oakland Chamber of Commerce and leading educators throughout the West.
- Home influences. Ideal climate. Terms reasonable. School in session entire year.

# San Francisco and Los Angeles Produce Markets

## Los Angeles Markets

LOS ANGELES, July 14, 1909.

### Butter.

Extras have finally advanced and now stand at 60, or 2½ cents in advance of last week.

Produce Exchange wholesale quotations are as follows with actual selling price to the trade 2½c advance on Extras.

Creamery per roll .....55@60
Cooking ..... 23¾

### Cheese.

Southern California Anchor .....19
Northern fresh .....17
Anchor Young America .....20
Domestic Swiss .....20
Imported Swiss .....30

### Eggs and Poultry.

Eggs continue to advance with extras commanding readily 32 cents. Case counts also have advanced two cents.

Paying price f. o. b. L. A. are:
Eggs .....30@32
Case count buying price .....27

Dealers pay for live poultry f. o. b. L. A.:
Hens per pound 3½ up .....13@14
Stags and old roosters .....7
Fryers 2 to 2¾ lbs .....15@16
Broilers 1¼ to 2 lbs .....15
Broilers 2 lb .....19
Roasters 3 lbs and up .....20
Turkeys .....20@23
Geese .....13
Ducks .....12@13
Squabs .....1.25@1.75

### Live Stock.

The following quotations are f. o. b., Los Angeles, on all stock.

Hogs from 175 to 200 pounds.....7½
Prime steers .....4@4¼
Heifers .....3½@3¾
Calves per pound .....5
Sheep ewes per head .....3.75@4.00
Lambs per head .....3.25@3.50
Wethers .....4.50@5.00

### Potatoes.

Wholesale prices are:
Sweets per box .....3.50
New per lbs .....6@8
Early Rose local .....1.25
Burbank local .....1.35
New per cwt .....1.25@1.50

### Onions.

### Honey.

White comb .....15@16
Light Amber .....9@10
Extracted W W .....7@8
Extracted light amber .....6@7½
Beeswax per lb .....24@28

### Hay.

Scott & Magner Say: Arrivals of hay for the week have been 330 tons. There has been no particular change from the conditions that have prevailed here for some two weeks past. The market has continued dull for the reason that the demand is decidedly moderate. None of the large consumers who generally lay in a winter stock, have come into the market to buy as yet, as they consider the prevailing prices too high to make any extensive purchases.

There has been very little fancy wheat hay offered, as this type of hay is mainly going into warehouses in the country for storage purposes; therefore fancy wheat hay during this week has been sought for, and that article is exceptionally firm.

Export Trade is very light, as there has been very little hay moving on that account for some time past.

Alfalfa hay is in moderate demand, and although very little has been coming in of this type of article, there has been plenty to supply all requirements of the trade, and the market remains fairly steady, but not active.

This week's quotations are:
Choice wheat hay .....17.50@18.50
No 1 wheat or wheat & oat 16.00@17.00
No 2 wheat or wheat & oat 14.00@15.50
Choice tame oat .....16.50@17.50
Other tame oat .....13.00@14.50
New crop wild .....12.00@15.00
Stock hay .....7.00@9.00
Alfalfa .....10.00@14.00
Straw .....60@75

### Grains.

Wheat No. 1 .....2.07½@2.12½
Barley .....1.42½@1.45
Oats white .....1.90@2.15
Oats gray .....2.00@2.10
Rye new crop .....1.40@1.45
Corn Egyptain .....1.60@1.65
Corn Cal sm round .....1.80@1.87½
Alfalfa seed, Cal .....16@18
Mustard yellow .....5¾@6
Mustard brown .....3¾@4½
Millet .....2½@3
Broom corn seed per ton .....28.50

### Feed Stuff.

Bran per ton .....29.00@30.00
Feed cornmeal per ton .....39.00@40.00
Cracked corn per ton .....40.00@41.00
Rolled barley per ton .....31.00@32.00
Rolled, oats per ton .....36.00@39.00
Oil cake meal per ton .....38.50@40.00
Cocoanut cake per ton .....25.00@26.00
Middlings .....33.00@35.00
Mixed feed per ton .....26.00@30.00
Shorts .....31.00@32.00

## Deciduous Market

The fore part of the week there was a decline in the market in all varieties, which is a general thing after the Fourth of July trade is over. However, the market has picked up very well, and there is a good demand for peaches and plums. The auctions yesterday averaged as follows:

Tragedys $1.25 to $1.60, Royal cots $1.15 to $1.70, Burbanks $1.05 to $1.25, Hales 60c to $1.05, Barts $3.00 to $3.45, St. Johns 60c to $1.25, Ogons 90c to $1.45, California Red $1.10 to $1.65, Botans 95c to $1.05, Triumph 75c to $1.00, Purple Duanes $1.05 to $1.25.

The principal varieties of plums going out now are Burbanks, Purple Duanes, Satsumas, Climax, Tragedys. There is a good demand in the East, however, for all plums with the exception of Burbanks which are somewhat a drug on the market owing to the large amount that has been shipped.

The principal varieties of peaches now going out are St. Johns, although these are cleaning up, and Early Crawfords are taking their places. The cash price to growers is 45c for Crawfords although they are being quoted to the trade at 65c to 75c f.o.b.

Shipments of pears from the State at present are heavier this year than they have been any other year at the same date; 41¼ cars being shipped yesterday as compared with 21¼ cars same date last year. The f.o.b. price is 1.50, and they seem to be moving very freely at this figure.

The whole outlook is very promising at the present time as there is a good demand for yellow peaches, pears and plums. The undesirable varieties of peaches are all shipped.

Total shipments to July 9th, 1908, 1,542 cars; total shipments to July 9th, 1909, 1,596 cars.—T. C. Tucker.

## Citrus Market

LOS ANGELES, July 14, 1909.

The market has not improved on sweets and seedlings but the output is practically all forwarded. There are possibly 3500 cars of Valencias yet to go. The outlook for these is encouraging. The present indications are even better than last week. Most of the fruit is of high quality and the trade is receiving it as fast as offered.

The estimates of next year's crop are still more or less of guesswork, but more definite ideas are being expressed than during June when most discouraging reports were given out. Some growers then maintained that next year's output would not be over ten per cent of normal. Present estimates are ranging from fifty to seventy-five per cent of the normal crop. If this is the case it is probable the prices secured will compensate for the shortage.

The cooler weather and larger receipts of foreigns have lowered prices on lemons somewhat, but they are still commanding fair returns and indicate a determination to continue the good prices during the season.

### Shipments.

Shipments of citrus fruit since November 1st, 32,701 cars of which 27,947 were oranges and 4,754 lemons. To same date last season, 26,221 of which 22,596 were oranges and 3,625 lemons.

NEW YORK, July 12.—Thirty-six cars oranges and three cars lemons

sold. Market easier on both oranges and lemons. Clear and hot.

## QUERIES.

(Continued from Page 67.)

show plainly that garlic grows seed too. I have now given up farming and have not time to watch results from planting seed.—J. G. Baum, Olive, Orange Co.

Courtesy Calexico Chronicle.
**Imperial Vineyards.**

In referring to my answer to the garlic query my language reads, "Garlic is propagated by division of the bulbs called cloves or sets." If I have anywhere written what your correspondent asserts, it was certainly a slip. While it is common knowledge that garlic will seed like the onion, it is the universal practice, so far as I have ever seen, to propagate it by division.—Q. A. L.

### Market Reports.

I would like to know why there is such a difference in price of spuds in market quotations and price offered by buyers. We are offered from ninety cents to a dollar. The buyers are robbing the growers, or the quotations need revising, as there should not be such a difference in prices.—Subscriber, Olive.

It is true the producer cannot usually secure the prices quoted in the Cultivator. It is also true that the writer cannot go to the market and buy for the quoted prices unless it be in the one case of local Burbanks quoted last week, which was really perhaps above the market price. This is because with freight and commission charges, and various juggling with the products, there is a vast difference between prices received by the producer and paid by the consumer. Of course occasionally there is a possibility of error in quotations, i. e., a line quoted one week may be allowed to remain over the week following through inadvertence, but as a rule the prices quoted in the Cultivator show the general range of the market. This is a matter which never can be corrected until the producers are organized and have a man qualified to handle their interests located in the markets where he can watch and secure honest returns from those who buy in a large way.

---

### Yellow Jackets.

In a recent issue of the best paper in the State, J. S. of Morgan Hill asks what to do with yellow jackets; and I am glad to pay back some of the favors I have received.

Take bits of fresh raw meat, gristle or bones with some meat adhering may be used, and either tack them to boards which are laid meat-side down across the tops of tubs half full of soap suds, or hang the meat above the suds with a string. The yellow jackets are very eager for meat, and will fight and jostle each other off the small bits exposed; the fellow who falls drops in the soap-suds; that gums his wings so he can not get out and he speedily drowns. The bits of meat should not be too large, and the water must be soapy, as they can get out of clean water. It is some trouble to renew the traps every morning, but the results more than justify the labor.—Bee Josephine O'Mealey, Kanova Ranch, Anderson.

# Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Heaves.

What is a good remedy for the heaves? My horse has them very badly, brought on, we think, by feeding alfalfa hay. We are feeding grain now.—H. H., Burbank.

There is no cure for the heaves. Feed a concentrated diet, less hay and more grain. Dampen the hay and put a small piece of lime in the drinking water.—R. T. W.

### Eye Trouble.

What is the matter with my horse's eye? She holds it half shut and there is a small white spot like a growth in the lower corner of the eye. It does not water.—D. R. M., Compton.

Get the following preparation and use it in the eye. Inject a few drops with a curved medicine dropper five or six times daily. Adrenolin two drams, water sufficient to make two ounces.—R. T. W.

### Poor Teeth.

For about six weeks my horse has not been eating well. Doesn't want anything but barley. Is growing thin, moves about the corral slowly, and drips saliva from his mouth all the time.—F. C. T., Santa Ana.

Have his mouth washed out every day with the hose. Feed alfalfa hay and have his teeth attended to by a good dentist.—R. T. W.

60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it fails to do this, any money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

# The Latest Regarding the Thrips

## An Advance Report by Dudley Moulton of the Work of Department Specialists in Studying the Life Habits and Control of the Thrips

THE problem of controlling the pear thrips has become a very acute and important one in many of the deciduous fruit sections in California, and although the insect seems hard to control it has now been shown conclusively that this insect can be checked by proper and careful treatment. It has been well demonstrated that plowing and otherwise cultivating the ground during October, November and December, when the insect is in the pupal condition, reduces its numbers very noticeably, and also that spraying with a combination of Distillate Oil Emulsion and Tobacco Extract, when the thrips are on the trees will kill a very large percent, practically all of those which may have escaped the earlier treatment.

Cultivation and spraying, it will be found, are both so directly subject to weather conditions (and each must be done at its own proper time to be effective), that orchard work such as pruning and spraying for other insects must be considered well beforehand and completed or so arranged that they will interfere but little with the treatment for thrips. Forethought and carefulness of work, it will be found, are most important factors if the treatment is to be entirely successful.

**Life History.**

The life history of the pear thrips in brief is as follows: Adults begin to appear about the 15th of February, although a few individuals may have come up earlier than this; they are numerous after the 18th and by the 25th they are common everywhere. They continue coming up from the ground in maximum numbers between February 18th to March 16th. At this later date practically all are out. A few individuals may come out even as late as March 30th, but these are of no consequence.

The adult thrips feed in the opening fruit buds, in blossoms, and on foliage for a period of about 5 to 6 weeks. They begin to place their eggs about March 15th and this period of oviposition continues until about April 10th. The adult insect is furnished with a saw-shaped ovipositor with which she first cuts an incision into the tender leaf or blossom stem and then forces an egg down into the plant tissue. The adults die after oviposition is concluded. The egg is at all times protected and can not be reached by spraying.

The larva hatches after about 4 days and comes out through the cut in the plant tissue through which the egg was passed when it was laid. The larva feeds for about 3 weeks and then drops to the ground and penetrates down several inches. It encloses itself in a little earthen cell, enters into a resting condition and remains here until it comes out in the following February or March. The insect thus remains in the ground for about 11 months.

The period when thrips larvae are dropping from the trees and entering the ground continues from about April 10th to 30th and all have left the trees by the 8th or 10th of May.

**In the Soil.**

Many careful examinations of soil from under trees in infested orchards have been made to determine the depth to which the thrips lavae penetrate before they locate permanently. With ordinary conditions of cultivation it has been found that about 80% of the thrips are within 8 or 9 inches of the surface and within reach of the plow although previous conditions of cultivation and the texture of the soil regulate the depth to which thrips penetrate to a very large degree. In one orchard 74% of the thrips were between the surface and 6 inches deep, 88% down to 7 inches and 94% between the surface and 8 inches. In a second orchard 71% were within 8 inches and 81% within 9 inches of the surface. In a third orchard 75% were within 8 inches and 80% within 9 inches of the surface. The insect passes through its pupal development during October, November and December within its little cell in the ground and it is then more sensitive to mechanical injury than at any other time of the year. Our method of plowing followed by harrowing, and a second cross-plowing, followed by careful harrowing or cultivation in October, November and December, or after the first early rains, breaks the most of these thrips from their protecting cells and usually so injures them that most will die. By actual tests it has been found that from 70 to 73% of all the thrips in the ground may be thus killed by the plowing method alone.

This treatment is not sufficient, however, to protect the trees if the infestation is bad, and spraying in March and April should also be adopted in conjunction with the plowing.

**Sprays.**

Spraying for thrips has proven wonderfully successful wherever proper sprays have been used and the work done immediately on time and with thoroughness and care. Indifferent and careless work or improper sprays are not effective. The thrips must first of all be reached. This necessitates high pressure, 125 to 180 pounds, and a rather coarse penetrating spray such as may be thrown from a Friend Vermorel nozzle. It is necessary also that the spray be directed downwards into the buds and not thrown at them from below or from the sides. It should be remembered that spraying is done not to drive the insects away or to protect the trees from any possible future attack, but to kill those insects which are actually present on the trees. A tower platform should be built over the spray-wagon wherever the trees are large so that the upper branches can be properly sprayed. Almost all of the standard spray formulas have been tried out and all except two have been eliminated. The bodies of the thrips, both adults and larvae are decidedly oily and strongly resistant to all sprays which do not assimilate readily with oil. For example, the lime-sulphur solution which is ordinarily very caustic and penetrating may be thrown on to the thrips and it will merely gather in globules on their bodies and not penetrate to kill them. Both larvae and adults have been observed to actually float around in the ordinary soap and lime-sulphur sprays with no apparent inconvenience. Dry sprays are also absolutely ineffective. Emulsions of oil combined with crude carbolic acid or crude creosote are extremely penetrating, in reality killing almost every thrips that they touch, even when applied in a very weak form, but these combinations are just as violently injurious to blossoms and leaves as to thrips so they cannot be considered at all. Poisonous sprays are ineffective because the thrips feed upon the inner parts of the plant and not from the outer layers where the poison would be placed.

Black Leaf Tobacco Extract diluted 1 to 50 has been very successful, but this spray seems to demand a somewhat heavier and more penetrating liquid than water alone, as a carrying agent. The distillate oil emulsion in 6% dilution is almost as deadly as the Black Leaf, but there will follow some injury from the spray unless conditions are altogether favorable. The oil spray has the advantage of being heavier, of being forced more easily into the buds, and penetrating the oily coating offered by the thrips. This emulsion, however, reduced to a 1½ or 2% solution can be applied with apparent safety to all trees and combined with Black Leaf diluted 1 to 60 or 1 to 70 it furnishes a spray having all the required carrying, penetrating and killing qualities desired. This is the spray which is now recommended. It can be applied with safety to opening buds but should not be used on trees in full bloom. This spray can be applied to trees immediately after the blossoms have fallen and later on the foliage for adults and larvae. The first application should properly be made when the thrips are coming from the ground in maximum numbers and before the cluster buds are too far advanced. This period in the San Jose district is early in March, but it, of course, differs for the several varieties of fruits. An effort should be made to kill all adults in an orchard before March 15th, when practically all thrips are out from the ground and when oviposition begins.

The Black Leaf Tobacco Extract can be purchased from local agents. Directions for preparing the distillate oil emulsion, with other recommendations for plowing and spraying are prepared in a new circular on the Pear Thrips and will be ready for distribution about Sept. 1st.

# With the Citrus Growers

## FERTILIZATION OF ORANGES.

JUDICIOUS and liberal fertilization is essential to the intensive culture of citrus fruits. Cultivation, pruning and irrigation, necessary as they are to the success of the plantation, fail in their object—once the natural fertility of the land is exhausted or sensibly reduced—if the plant food absorbed from the soil be not replaced.

The removal from the soil of the constituents of a succession of crops brings about sooner or later, sterility or exhaustion of the soil from default of nitrogen, phosphoric acid and potash; and this sterility or exhaustion cannot be prevented or remedied by any system of cultivation. Field operations carried out with thoroughness do, indeed, restore to the surface soil the elements of fertility which the rains wash down into the sub-soil, they hasten their solution and prepare them for assimilation by the plant, but they replace nothing. It is indispensable therefore to make good the deficit, and, by means other than cultivation, to restore to the soil what the crops have removed from it. On this fact is based the use of manures, and in manuring skilfully and adequately lies the secret of successful fruit growing.

Barn-yard manure used in moderate quantities will restore to the soil, to some extent, the elements removed from it by continuous cropping, but in the case of citrus fruits it will be inadequate to increase production; employed in greater quantity and to an excessive extent, its effects are rather injurious than favorable, since it gives rise to all the evils attendant upon the application of organic nitrogen in too large proportion.

Moreover, although barn-yard manure is, in a general sense, termed a complete manure, it does not, when employed alone, satisfy the requirements of citrus trees, inasmuch as the quantity of some of its constituents needs to be supplemented if heavy yields and healthy vegetation are to be maintained.

Fortunately, the rational application of manures is daily becoming better understood, and the grower is now in a position, by the aid of chemical fertilizers, to raise the yield of his plantation to a maximum, and, at the same time, to secure for his trees that vigor of growth which enables them to resist unfavorable climatic conditions and parasitic attacks.

Liberal and judicious fertilization is essential to profitable results in the culture of citrus fruits; and the grower should be the less inclined to stint outlay in the purchase of fertilizers, because he may be certain of obtaining highly remunerative returns in the yield and quality of the crop. The orange tree, in particular, is one that responds generously to generous treatment by producing fruit of the highest quality and in enormous quantity.

To manure rationally, it is necessary to take into account the nature of the soil, the composition of the plant, its food requirements, the quantity and constituents of the crop and the conditions of vegetation. Acquainted with these, we are able to determine, with an approximation to scientific accuracy, what are the elements that have to be supplied and in what proportion.

Picking Oranges at Redlands.

The chemical composition of the orange tree—as well as that of citrus fruits generally—is complex, and varies somewhat widely, but the following, which represents the mean of a large number of analyses, will serve as a guide in the employment of manures:

Analysis of Orange Trees.

| | In 100 parts. | | | |
|---|---|---|---|---|
| | Nit. | P. Acid | Pot. | Lime |
| Fruit | 0.32 | 0.38 | 0.32 | 0.45 |
| Leaves | 0.70 | 0.10 | 0.32 | 0.71 |
| Trunk and branches | 0.70 | 0.43 | 0.58 | 0.80 |

These data clearly indicate that no one element distinctly dominates the others; for although lime is present in quantity, that base exists in abundance in most soils and may be disregarded in the preparation of formulae of manures, sufficient of it being applied in combination with phosphoric and sulphuric acids.

In the case of trees, like those of the citrus group, whose foliage is perennial, and which are of comparatively slow growth and subjected to only limited pruning, the elements of fertility consumed in the formation of leaf and wood are relatively small in quantity, and the greater part of the plant-food assimilated is expended upon the fruit. Thus, in determining the nature and quantity of the

manures to be applied, the production of fruit is the principal factor to be taken into account in arriving at the volume of plant-foods abstracted from the soil and consequently having to be replaced.

Let us suppose that an acre of orange plantation (about 100 trees) produces twelve tons of fruit. According to the analysis given above, this crop will contain:

| | Pounds |
|---|---|
| Nitrogen | 85 |
| Phosphoric acid | 102 |
| Potash | 85 |

It will be necessary, then, to restore these elements to the soil, in one form or another, if the trees are not to suffer from want of nourishment and to cease to produce maximum crops of good quality.—Joseph Hillman.

## HISTORY OF THE JAPANESE PERSIMMONS.

KAKI, or the Japanese persimmon, is a native of Japan, Corea and parts of China. There it has been growing wild in the forests from time immemorial. It is a delicious fruit in the wild state, as it grows in Japan, hence the Japanese have taken a great fancy to it, even in its unimproved condition. The persimmon is to the Japanese what the orange is to the Floridian. This love for the fruit even in the wild state soon created a desire for its cultivation and improvement.

The persimmon has been cultivated for centuries in Japan. There it has received more care and attention than any other Japanese fruit. It has been improved to such an extent that there are now many varieties. The Japanese serve and preserve it in many different ways. Various methods of preserving and curing them are in use. In fact, this fruit is now to Japan what the apple is to the United States. It is the national fruit.

There is almost no literature to be found on the Japanese persimmon in this country. Several reasons may be given for this fact. First, it is a comparatively new fruit. Second, there are only a few sections in this country where it can be grown successfully. Third, people must learn to like the fruit, hence there has been no market for the fruit until recently. Fourth, until a short time ago, the value of the fruit was not known in this country. It is somewhat difficult to trace its introduction into the various Southern States.

In 1863, the Department of Agriculture became interested in the Japanese persimmon and a large number of seeds were sent to the Department by the American Legation in Japan. These seeds were sown in the open ground. The plants grew well that season, but as the following winter proved to be a severe one, most of them were killed. Several other importations of seeds were made, but with the same unsatisfactory result, although some of the varieties proved to be more hardy than others.

As a result of these attempts the idea that the Japanese persimmon could be successfully introduced by seed was given up. It was then thought that if the young trees of the hardiest varieties could be secured, the introduction might prove successful. This was done, but the severe winter following again killed the trees.

Then budding and grafting the hardiest Japanese varieties on the American species, Diospyros Virginiana was attempted. The budding proved to be unsuccessful. The grafted trees did well during the growing season, but in the severe winter which followed they were killed. This discouraged the Department and the idea of introducing the Japanese persimmon was given up for some time.

About 1875, a large number of trees were imported by the Department and by private parties, and were sent to nearly all of the Southern States. These importations proved successful, and since then the Japanese persimmon has been planted in nearly every State in the South, and it is now a fruit of considerable importance both for market and home use, especially the latter.

Kizo Tamari, in the Report of the Michigan State Horticultural Report for 1886, says: "Mr. S. Truda was the first to import our persimmon (D. Kaki) into this country; he tells me that the importation cost him considerable pains, and he further states that the fruit was not appreciated at first by the Americans at Tokio, being discarded in America as not eatable; but at present the fruit is well known by every pomologist in this country and is called the Japanese persimmon."

## BLACK SPOTS IN ORANGES.

This disease is one that is very prevalent in some of the orange orchards near Sydney. Like melanose, it lowers the market value of the fruit. The round sunken spots are often large and conspicuous, and seriously mar the appearance of the fruit. The center part of such spot becomes grayish or whitish when the fungus causing the disease is mature, at which time several minute dark pustules appear in each spot. These pustules give rise to a multitude of spores (seeds) of the fungus, and as these spores germinate readily when they come in contact with the fruit, the disease spreads very rapidly; thus fruit that was perfectly clean and free from the disease, as far as it was possible to see, during the month of August, or even September, (equivalent to February and March on this side of the Equator) was very badly diseased the latter part of October and through November.

The disease does not appear to attack the fruit to any extent till it is thoroughly ripe, when it spreads very rapidly, greatly disfiguring the fruit and rendering it more or less unsaleable; in fact, very badly infested fruit falls from the tree and is valueless. The disease spreads very rapidly among ripe fruit. As the disease apparently confines its attack to ripe fruit, the treatment that will probably be most efficacious will be spraying the fruit at intervals of ten days or two weeks at the time the fruit is most liable to attack—say from the middle of August to the end of September for the county of Cumberland—with a fungicide which will destroy the spores of the fungus; or, if it does not actually destroy them, prevents their germinating. The best remedy to use for this purpose will probably be ammonia carbonate of copper.—Agricultural Gazette of New South Wales, Australia.

## SOIL EXPERT.

Prof. A. J. Cook of the Claremont Horticultural Club is now in Washington making an effort to induce the Department of Agriculture to give the services of a soil expert to work in Southern California and determine regarding soil conditions, especially in the citrus orchards. Prof. Cook writes us:

"Messrs. Powell and Woglum have done us great service in pushing conjecture to the wall. We need light as greatly in the line of soil nourishment."

We trust that Prof. Cook will succeed, for not only the chemical, but the mechanical condition of the soil is a factor less understood by soil culturists than it should be. The "conjecture" on which many orchardists are working should be, as Prof. Cook expresses it, pushed to the wall and facts determined as soon as possible. Expenditure of money in the purchase of fertilizers which are not needed is the cause of immense loss.

# Deciduous Fruit Culture

By J. W. Mills

### UNITED STATES STANDARD BOXES.

THE effort to secure the passage of a bill in the United States Congress for standard sized boxes for all apples has stirred up opposition on the entire Pacific Coast. Apple growers in Oregon and Washington have been up in arms, and the Pajaro Valley people have not been asleep by any means. It seems that the bill is presented by the National Apple Shippers Association, and while such a regulation might be for their convenience to a certain extent, it would cause much loss to apple growers and much inconvenience in the complete change of all packing methods. The Orchardists Association of the Pajaro Valley and other organizations in the same section forwarded some time ago a communication which stated the case of the western shippers to the Hon. J. C. Needham, representative of the district most concerned in apple culture, and to Senators Flint and Perkins. From this letter we quote:

"On investigating the Lafean bill we find that when apples are packed in boxes that the capacity of the box must not be less than 2340 cubic inches when measured without distention of sides, tops and bottoms, and further provides that any boxes which contain less weight than this should be marked on end and side in large letters "Short Box," or with the number of cubic inches the box actually contains.

"In this connection would say that the style of packing apples varies in different parts of the United States, according to the variety and also the custom of packing in each district. The various sizes of packages as well as the different styles of packing are in existence for the simple reason that each has been found to be the best for the particular district using it.

"The Standard Apple Box of the Pajaro Valley contains 2268 cubic inches, measuring the box without distention. This box is well known in all districts purchasing our apples, being known as the Standard Apple Box.

"We see no reason why apples should be singled out from the vast quantity of food products that are sold in packages. Table cereals, canned fruit, vegetables, meats, fishes, sauces, pickles and other condiments, extracts, flavors, confectionery, crackers, pastry, chewing gum and other articles are sold in cans, boxes or packages, and the law does not require that the weight or measure of the contents of said package should be indicated thereon.

"The Food & Drug Act of June 30, 1906, certainly protects the consumer, as a packer or dealer would be liable under the law for mis-branding a package. We, therefore, claim that this point is absolutely taken care of and it is unnecessary to have another law for the purpose.

"We understand also that the same bill attempts to define a grade under which all apples should be packed, to be known as "U. S. Standard." Section 6 of the bill contains a description of the apples that can be packed under that grade.

"We maintain that the provisions of this section are too loosely drawn and could be of no benefit whatever to any body concerned in raising, buying or eating apples. There are scores of varieties of apples grown in the United States and in order to have a law that would be proper and just, it would be necessary to define and describe the weight and packing of each particular variety.

"Bearing these various points in mind, we cannot see any reason at all for this bill becoming a law, and we believe it to be vicious legislation of no good whatever except to put the control of the apple business in the country in the hands of a body known as the National Shippers Association, which body is pushing the bill, endeavoring to have it adopted."

The letter is signed by the Pajaro Valley Packers & Shippers Association, By W. H. Benteen, Pres. Chamber of Commerce, By E. A. Hall, Pres. Orchardists Association, By C. H. Rodgers, Pres. Merchants Association, By A. L. Bixby, Pres.

### PRE-COOLING PLANT.

The Cultivator representative now in Placer county sends us the following regarding the recently constructed pre-cooling plant:

Newcastle has a new pre-cooling plant. The first car left here June 17th in charge of a man to test it through to Minneapolis. He reports from North Platte, Neb., that the car had gone through so far with but one icing, at a temperature not higher than forty-six degrees. The fruit packed for shipment is placed in a cooling box of 1800 square feet, having a capacity of 1000 boxes at a time. Placed on an endless chain under slow speed, it takes two hours and twenty-four minutes for an individual box to pass through, or it can be regulated to pass through in one hour and twelve minutes. As the temperature in the cooler is kept at twenty-six degrees the fruit comes out cold and free from moisture. The officers are : Geo. B. Kellogg, President; P. M. Groom, Manager; John Heim, Secretary and Treasurer; M. W. Groom, Patentee.

### VALUABLE BULLETINS.

The white-marked tussock moth, for many years a dreaded pest of village and city shade trees, last year became destructive in many apple orchards in northwestern New York and was thus brought strongly to the notice of Station entomologists. Bulletin 312 of the Station at Geneva gives an outline of this outbreak, with brief descriptive notes on the insect, and indicates the repressive measures that should be adopted.

In Bulletin 314 of the same Station another more fundamental orchard problem is attacked—the proper management of orchard soil. A careful perusal of the data here presented should convince every orchardist that, unless his conditions are very peculiar, he should regularly cultivate the soil beneath his trees, supplying humus by means of late summer cover crops. A five years' comparison of tillage and sod mulch proved tillage superior in every point but one. The apples from trees in sod were slightly brighter colored, but were inferior in quantity, size and quality.

### PECULIAR LITTLE MOTH.

One of the Cultivator force recently captured a peculiar looking little moth which, when at rest, seemed to have two immense horns extending from its head at right angles to its body. They appeared even larger than its entire body. When disturbed, however, these "horns" spread out as wings. Projected as they were when at rest, they were perhaps an inch and a half from tip to tip. The little fellow was sent to Mr. S. A. Pease, the San Bernardino County Bug Expert, who writes: "This is a very interesting species partly on account of its peculiar form. It is called Pterophoridae, a Feather-winged moth. These moths are easily known by their wings being divided lengthwise into narrow, fringed branches resembling feathers. When at rest, the wings do not cover the body but stand out from it on each side, not spread however, but folded together like a fan, so that only the outer part of each of the fore wings is visible. They feed on the young leaves of grapes and when about to change to chrysalids fasten themselves by the hind feet and by a loop over the back. They are attracted by light."

The keeping qualities of nuts, which enable them to be held until a convenient time for marketing arrives is a strong argument in their favor as compared with common fruits, such as peaches, pears or berries, where bad markets, bad weather or other accidents often result in serious losses after the crop has been successfully grown. All of these pitfalls have no terror for the man who has a crop of pecans or nuts of any kind ready for market.

# Live Stock and Dairy

By Mrs. Minna E. Sherman

**Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.**

## VALUES.

THE breeder of fine stock is constantly up against the opinions of those who do not consider that it costs more to start in with pure bred stock than it does with mere scrubs. The men on the ranch are often amused by the remarks of would-be horse buyers. One of these stopped a man in town driving a pair of registered Percheron fillies to know if they were for sale. When the man told him he did not know but would call up the foreman, he said, "Those people will want at least four hundred dollars for that pair of mares, for they are rich." I was amused, for there would be no difficulty in the present state of the horse market in securing at any time that amount for either of them as draft animals, without considering that every horse colt they dropped would find ready sale as a weaning for as much as he considered the value of the dam. However, in the hands of the man who wished to purchase them that would not perhaps be true, for he would breed them to some crossroad horse, or perhaps another breed, and have nothing to show for their breeding.

I sold a fine well graded up Percheron mare to a man some time ago, only to hear that instead of continuing to breed her to a pure bred stallion, he had patronized a miserable grade beast because the owner offered him free service, saying the colt would prove a good advertisement for his horse. The farmer did not stop to consider where he would come out in the transaction. It is too bad to use this poor class of horses. Not that I would wish to rob a poor man, but it is unfortunate that the horses in this country are not on the upgrade all the time. There are enough influences to pull them down all the time in size, by underfeeding and accidents without deliberately breeding down the quality. Raise one colt or one calf instead of two unless you can afford to raise both well.

### Cows.

The cows bred for dairying are the best, and there are few poor cows among the pure-bred ones if they have been fed well from birth. Scrub treatment of registered stock only affects one generation, and that is the one starved. I bought two full-blooded cows early in my dairying experience that had been given the worst of scrub treatment. They never developed much themselves, but their daughters raised on the ranch were as good as any of the others. So blood will tell and inheritance come out. By poor cows I mean the cows that fall under 300 pounds of butter a year. I nave never raised a full-blooded cow on the ranch that did not make over this, except in a few cases where they had been accidentally injured.

Breed then must be sustained by feed. This is natural as the breeds were first made by selecting the best cows and feeding them for generations, while the others were sent out to rustle for themselves. Cereals and legumes, with a few of the vegetables such as pumpkins, beets, cabbage and kale, make up the best cow feed. Fruits are not good, though dried figs well soaked can be fed to cows in small quantities but do not bring in the returns that come when fed to hogs.

Raisins are capital horse and pig feed. Some of the ranch horses were fed all winter on half raisins and half rolled barley until two months ago when they received all raisins and alfalfa hay. They are today rolling fat, and are strong in spite of hard work in the long vineyard rows. I had one cow under treatment yesterday for eating raisins accidentally left in an open box at the pig pen. On the fourth of July when everybody was off to town, she slipped into the lane and gobbled raisins for an hour. Then she had pain and had to have a big dose of olive oil and baking soda to relieve the trouble. It will not do to give free rein to the tastes of cows for raisins or they will soon be suffering from indigestion. In feeding figs to a cow, five pounds of soaked figs and ten pounds of alfalfa hay will be found to make a good feed twice a day. Then for roughage feed some straw or corn stalks. This makes a good ration for dry cows and will keep them fat and the heifers grow on it thriftily. I have no doubt that many times they receive more than this when we are feeding figs for they are spread out before them. The only point to bear in mind is to begin any feeding of a different fruit or food slowly and gradually.

### Care in Feeding.

The dairy cow is one of the hardiest animals we have if she is given half a chance. Even careful dairymen take great risks with cows. Only the other day a cow completed a world's record after being kept in a stable for thirty days and surfeited with rich food. Then she was turned out with the herd to take pneumonia and die. Surfeiting cows produces the same effect as in human beings, that is, a gorged condition tending to congestion and colds.

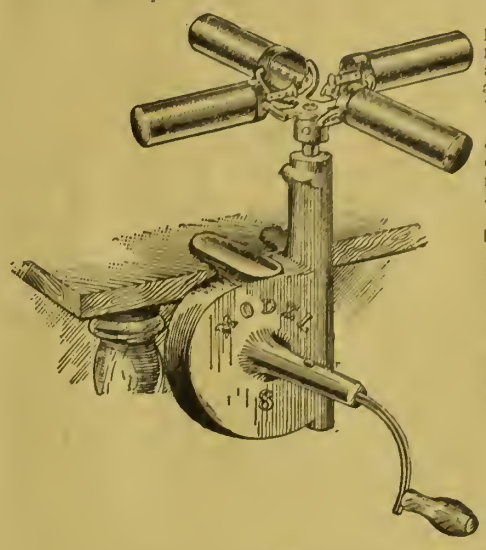
One of the causes of loss on the farm is lack of sticking to the point. When the breeding is begun along a certain line, keep to that line. Do not first use a Jersey sire and then an Ayrshire. Both are good, but when mixed on the cold blood of common stock a hopeless mongrel is produced. Do not breed horses of the roadster class for farm work. If there are some not equal to road work in buggies, turn them off for light delivery work, while the heavy carriage type misfits make fire engine horses. The draft horse never seems to be a misfit anywhere, for while beauty and style command higher prices, still the gravel hauling teamsters need horses that can draw loads without regard to the style that the brewer, meat or mill teams must have to be saleable.

### Fast Walkers.

Prof. Fraser has given an amusing story of seeing cows and horses working together in the fields abroad. He observes, "It is not thought to injure the flow of milk if the cow is groomed and fed the same as the

**Do your cows milk hard? Send 50 cents for teat expander. .O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

# Improved Babcock Tester



Babcock Milk Tester, an extremely simple, light, compact and carefully designed apparatus, especially adapted for use in the dairy and also on account of its light weight to the Traveling Dairy Inspector.

The working parts are entirely enclosed in a handsome cast-iron case, and consist of but two cut gears, namely, bronze spiral gear and steel spindle with worm thread.

The Tester is fitted with swinging pockets and malleable iron head; it turns very easily without any vibration or jar and can be readily attached for operation to any table or bench. The bottles are perfectly horizontal when rotating.

| | wt. lbs. | |
|---|---|---|
| No. 1 2 bottle for milk, | 14 each | $5.00 |
| No. 2 4 bottle for milk, | 14 each | 6.00 |
| No. 3 2 bottle for milk, and cream | 14 each | 5.50 |
| No. 4 4 bottle for milk, and cream | 15 each | 7.00 |

Price includes full directions for making test, bottle of acid, test bottle brush, acid measure, pipette and test bottles.

# The United States Cream Separators

***Lead the Separator procession in every particular***

The UNITED STATES make **cream of any desired density** from **twenty** (20) to **sixty** (60) per cent. butter fat.

**Read what experts and users say:—**

**Montana Agricultural College and Experiment Station.**

Bozeman, Mont., Feb. 8, 1909. This is to certify that the United States Separator that has been constantly in use here at the Dairy Building of the Montana Agricultural College **has given** us **splendid satisfaction.** In light running and durability, the machine is strong and in skimming capacity the No. 5 that we have at the present time has **skimmed as close as .02 of 1 per cent. taking a 35 per cent. cream.**

W. J. Elliott, *Prof. of Dairying.*

**Ohio State College.**

Columbus, O., April 20, 1907. The No. 6 U. S. Separator in our laboratory with the low milk can is a great improvement. We have required it to take a **thick cream over 40 per cent.** fat and **several times** it has been **over 50 per cent.** The **test** of the **skimmilk** is usually **.01 to .02 per cent.** fat. I am glad you still keep up the solid frame and fine workmanship on the running parts, as competition with cheap machines is getting keen.

John W. Decker, *Prof. of Dairying.*

Everett, Washington, Jan. 8, 1907.

I hereby certify that I tested a sample of cream and skimmilk taken from Geo. Crocker's U. S. Separator some time ago and the **cream tested 66** per cent. and **skimmilk a little less** than **two one hundredths** of one per cent. I will further state that I am not now, nor never was, agent for the U. S. Separator. F. J. Adkins, *Buttermaker*, Everett Creamery.

*Subscribed to and sworn to before me this 8th day of January, 1907.*

Thomas W. Cobb, Notary Public in and for the State of Washington, residing at Everett.

*We can furnish thousands of testimonials of like tenor.*

*Send for "U. S. Short Story" booklet, also Catalogue No.* 20

# Malthoid Roofing

Mr. H. B. Eakins, of the Commercial Warehouse Co., Los Angeles, Cal., U. S. A., writes: "Now that we have had two good rains to test our Malthoid roof, we have desire to express our satisfaction in the knowledge that we have a covering over our head that does not leak. We write you regarding our pleasure in this matter from the fact that we had fully expected more or less trouble, as we did not believe it possible that so large a roof surface could be covered with any material and stand the test of a first rain, but there was not a leak due to defective roofing."

horse and worked half days." The economy of working the slow moving cows was shown in one case where three cows and a horse worked together on a plow, turning over one acre in two and a half days, making an eight inch furrow nine inches deep. Slow plowing is hard work on animals. The quick walkers get to the end of the furrow with less strain than the slow team that grinds along. The best work on a ranch is done by the young teams, and the horses should be sold off at eight years old. In this way the income from the mares is kept constantly coming in and the horses are passed along in their prime to the city trade that wishes quick movers and hardened animals. If the old horses are kept on the ranch they grow slower and slower until it is hard to see them move at all sometimes.

—M. E. Sherman.

## THE HOME CARE OF MILK.

One of the placards displayed in the dairy car of the demonstration train was as follows:

The most perfect milk can be quickly and easily spoiled.

The first matter of importance is that our milk should be kept at a uniformly low temperature from the moment it is received until it is used, preferably at about forty degrees Fahrenheit.

No milk can be properly kept without the use of ice in hot weather.

It is never safe to open milk and cream, and, after removing part of it, leave the jar uncovered, expose the milk in open pitchers, or return any that has been exposed in pitchers again to the original jar.

It is never well to keep milk or cream that has once been opened, in a refrigerator that contains other foods.

It is never wise to expose milk or cream to the usual air of the kitchen, the pantry or the nursery, except for such time as is necessary to obtain what is needed for immediate use.

It is very unwise to put milk into any vessel or pitcher that has been washed in dishwater and wiped with a kitchen cloth. Vessels to be employed for milk should be boiled in clean water and left for use unwiped, with the mouths turned down, and in a clean place.

It is best and safest to use milk at mealtimes from the original bottle in which it is received.

Never cook or boil milk, especially with cereals, in a vessel used for general purposes, but set aside a special vessel and boil it in clean water before using for cooking milk.

## AYRSHIRE SPECIAL PREMIUMS.

The Ayrshire Breeders' Association offers the following special prizes for the season of 1909.

$600.00 in special premiums on the individual entries, with five premiums in each class, at the Alaska-Yukon-Pacific Exposition at Seattle Washington in September 1909. Also a special premium of a silver cup valued at $25.00 called the Secretary's cup is offered through the Ayrshire Breeders' Association at the Alaska Yukon-Pacific Exposition, for the best Ayrshire cow in milk, of any age, bred by the Exhibitor.

$300.00 in special premiums on the individual entries at the National Dairy Show in 1909. There is also offered through the Ayrshire Breeders' Association, by a friend, a handsome sterling silver cup valued at $125.00 called the New England Cup, for the best young herd bred by the exhibitor, (except that the bull may be bred by other than the Exhibitor) Entries to this special prize cup, limited to members of the Association living in the United States.

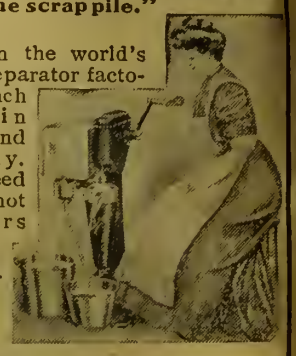
Animals entered in all the above classes shall be registered in the Ayrshire Record and owned by the Exhibitor, who shall be a member of the Ayrshire Breeders' Association.—Brandon, Vt., C. M. Winslow, Sec'y.

**Cream Separators, all sizes, all prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.**

# Knocks Out 7

Dairy Tubular Cream Separators are entirely different from all others —are simple, sanitary, satisfactory.

Mr. St. John Backus, of Sloan, Iowa, writes:—**"I bought a Tubular "A" No. 6. Before buying this separator, I tried seven makes. None was satisfactory, so decided to try your Tubular. I found it more than satisfactory and could I not have returned the other makes, as I did, I would have consigned them to the scrap pile."**



Made in the world's greatest separator factory. Branch factories in Canada and Germany. Sales exceed most, if not all, others combined.

## CLOVER AS HOG FOOD.

They can't do it. Clover and alfalfa are great hog feeds; their importance is not to be denied; they can be used to the very best advantage, but you can't fatten hogs with either alfalfa or clover. You can grow them, but the best results are attainable only when fed in combination with a grain feed, the best of which is corn.—Swine-Breeders' Journal.

It is doubtful whether unlimited pasture may be considered economical, except perhaps for brood sows. The proper amount of land to give over to pasture must necessarily vary according to its quality and other local considerations, and the length of time the pasture will sustain hogs likewise is dependent upon the climate, quality of the crop, age and number of the animals, and other varying conditions. For an average it may be said that an acre of red clover should support six to ten hogs for three or four months, Alfalfa, the leading pasture plant for swine, should provide, if of vigorous growth, for twelve to twenty-five animals per acre, but an alfalfa stand should not be grazed by so many hogs that mowing will not be necessary for keeping it in the best condition. The practice with alfalfa should be to pasture fewer hogs than will be able to keep back a rank or woody growth.—From Coburn's "Swine in America."

# Losses

The following is a partial list of losses paid by this Association during the past year. We believe it is the strongest possible testimony as to our promptness in making payments.

This is the only purely mutual Company doing business in the State, and the only one that insures its members at actual cost. We have written over Three Million Dollars ($3,000,000) within the last year.

We refer prospective applicants to any parties listed below or to anyone who has ever done business with this Association.

Our Agents are located in every County in the State. Give us your address, and we will refer you to the nearest one.

Farmers and Stockmen should not fail to join this Association, as it is organized for the benefit of all owners of live stock. We insure against death from any cause or accident necessitating death.

## OPPORTUNITIES IN SEED BREEDING.

THE profits from any crop are largely dependent upon the reliability of the seed from which the crop is grown, writes P. K. Blinn, of the Colorado Agricultural College. A mixture in the variety, or a poor quality in the seed of some crops, may not be a very serious injury; but with a special crop like cantaloupes, that has market demands to meet, the use of poor seed may mean the total loss of a season's work. On several occasions in the early days of the cantaloupe industry at Rocky Ford, when the growers depended upon the seedsmen for their seed, entire fields were worthless on account of mixtures and unmarketable types.

The many strains of the popular Rocky Ford variety of cantaloupes have been named and renamed, regardless of merit, until the practical growers have come to disregard the names or claims for cantaloupe seed; but they do want to know: who grew the seed? What are his qualifications as a seed breeder? What is the performance of the seed?

This is a day of specialization in farming, as in other professions, and the man who wants seed of known qualities is looking for the grower that makes a specialty of a crop and its seed development, rather than the uncertain quality obtained of the seed jobber. No wonder that there is a constant demand for reliable seed of all our farm crops, when the leading seed houses of the country are not willing to stand back of their goods. On all their order sheets, they publish the following notice:

"We give no warranty expressed or implied, as to the description, quality, productiveness, or any other matter, of any seed, bulb, or plant we send out, and we will not be responsible, in any way, for the crop."

Such a statement is enough to arouse any man who expects to risk the season's work on seed purchased under such a contract.

A competent seed breeder, who is developing and selling only his own production, can consistently furnish a certificate that will give some assurance of the quality of the seed. The Rocky Ford Cantaloupe Seed Breeders' Association furnishes the following guarantee certificate:

"Cantaloupe seed accompanied by this certificate, with the seal and package unbroken, is guaranteed to have been produced by this Association in accordance with the by-laws and the most approved methods of cantaloupe breeding. The purchaser is hereby assured of first-grade selection, of a pure strain, and of a genuine Rocky Ford variety known as ----------Pedigree No.------

"This strain of seed has had------ years of individual test plat breeding. It was grown from registered stock seed, and was selected from a field grown exclusively for seed, where no melons were marketed. The requirements for this grade of seed were, fine netting, standard size, good internal qualities, and with no defects that would injure the seed or the crop to be grown from them. The germinating vitality of this seed is as perfect as experience and good equipment can produce.

"In testimony whereof, The Seal of the Association, and the signatures of its officers are affixed.

(Seal) ----------President.
----------Secretary."

Such a guarantee gives the personal reputation of the breeders and assures the grower of many facts he desires to know, as well as where he can get the same stock another year if the seed proves satisfactory.

There are many sections in Colorado that are adapted to the growth of seed for certain crops, and a great opportunity exists for residents of these localities to make seed growing a speciality.

It may be the growth of seed potatoes, onions, cabbage, celery, or alfalfa seed; and in other localities there are almost unlimited fields for breeders of pedigreed grains that are adapted to the several conditions in dry and irrigated sections.

Under a Grape Arbor in Honolulu.

## RAISING ONION SETS.

Some instructions for raising onion sets from seed, how to sow seed, harvest and market the crop, etc., are desired by a Nebraska reader. He has a light sandy soil, very productive, on which onions are doing well.

For onion sets we usually select a piece of sandy soil of fair fertility and reasonably free from weeds. The rest is easy. Sow at the rate of forty to sixty pounds of seed to the acre, making the drills one foot apart. Use the hand wheel hoe freely, which is about all the labor that ought to be necessary.

When the tops begin to die down, showing approaching maturity, the little bulbs may be taken up by running a trowel underneath the row, and thrown into a sieve to clean them from sand and soil. Put them on a dry loft or on sieves to cure, and when dry, store them in shallow and open boxes in a dry and cool place.

Send them to market in early spring. In our local markets we find but few white sets, mostly yellow ones, and hardly ever red ones (grown from Early Red onion seed). The famous Philadelphia white onion set is grown from Silverskin.—Farm and Fireside.

There is some contention at Riverside over the use of city sewage in the production of vegetables by Chinamen, which are afterwards sold to residents of the city.

# The Ornamental Garden

### GROWING "MUMS" AT HOME.

Would you like to grow chrysanthemums, and have them just as fine as the florist grows them? You may do it very cheaply and have them in quantities.

Select a space on the south side of the house, with the idea of using the wall as one side of the shelter you will need. Spade up a space three feet wide hy twelve feet long, making it very rich with well rotted manure. If it is one quarter manure it will not he too much provided it is well mixed.

Then in May get from your florist twenty-five plants, all different varieties, and all early bloomers, for three dollars. In planting, space them evenly. Give good culture through the summer, and that means keeping the soil loose, and ahsolutely free from weeds. Do not let the plants suffer from drought, but water abundantly if they need it.

You will get a thrifty growth if you do your part. If you want to practice dishudding and trimming to one stalk, you will get large blooms just as the florists do. But if you let Nature take her course you will get smaller flowers, but in greater abundance.

All through October and November, you will have an abundance of flowers for yourself and friends.

### FLOWER NOTES.

Keep the chrysanthemums well fertilized.

Cut up the fern roots and start new plants for next winter. Pot ferns in leaf mold and sand, and keep them in a shaded place.

Cut back tea roses after each period of bloom. Give the hybrid perpetual roses similar treatment. Keep the soil rich about the hybrids and the teas. Cow manure is the best fertilizer for them. Cut off the old blossoms from the Crimson Ramblers. In fact, all the withered roses should be cut off.

In watering flowers from a watering-pot, remove the nozzle and pour the water at the root of the plant. Pour enough so that the water will sink to a depth of four or five inches. When the water is merely scattered over the surface of the ground it does little good. In a dry season, do not water the flowers at all, unless you can keep up the supply of water as long as the drouth lasts. If the plants are watered for a while, only to be neglected later, they will pretty surely succumh.

In tying up vines about the house, use strips of leather; cloth and string will rot sooner or later.

Stake the gladioli and the dahlias.

### INSECT EXTERMINATORS.

Snails without shells, commonly called "slugs," get in their destructive work at night, and hide away in damp, cool places during the day. We know of no method of extermination so effective as to hunt them after night with the aid of a lantern and a sharp pointed stiff wire stuck through the creature. They are good feed for chickens. Those with shells climb and devour the foliage of plants. They can be exterminated by an application or two of Hammond's slug shot applied by putting it in a sack made of cheese cloth and dusting it on the plants in the morning while the foliage is damp. If after three days the pests are not all dead, put on a fresh application of the powder, and at the end of a week cleanse your plants thoroughly with water from the hose.

We have found little chickens to be the best insect exterminators of bugs and heetles, worms and milipedes. If given free range from the time they are big enough to run until they are big enough to do mischief by scratching, they are incessant in their work and devour multitudes of pests. After they arrive at that age, if cooped up, and fed well for a week or two, they are good eating. A half dozen are enough for a small garden, and now that they may be had at a reasonable price from professional incubator hatches there is no excuse for their absence from the garden. Their movements are intensely interesting while at work. If a hen is their mother, fasten her to a stake driven in by a box or barrel for shelter at night.—Pacific Garden.

A Beautiful Walk at Redlands.

Lawn clippings applied to rose beds, dahlia plants, chrysanthemum heds, are valuable fertilizers and should always be used in the garden. So also are the leaves of trees. To be sure, coarse material as here named can only be used where beds can and should be worked up once a month, and in sub-tropical beds, where six to twelve inches of water are necessary every week during the summer for luxuriant growth and fine effect.

### FLORAL HINTS.

Dahlias love a moist atmosphere.

Moisture is sure death to red spider.

Mignonette does not require much water.

Begonias like a moist, shady place in summer.

A tulip bed should be remade every three years.

Nearly all ferns like a moist, cool atmosphere.

Salt to slimy worms is a terrible dressing.

The fuchsia likes partial shade and plenty of moisture.

Cacti will endure all the sun that may he given them.

Do not water a plant till it needs it, then do it thoroughly.

Lifting plants should he done, if possible, on cloudy days.

A freshly potted plant will not stand stimulant, but a mass of roots will.

Deep trenching and liheral manuring is one secret of a good rose bed.

When seed is not to be saved, plants should never be allowed to bear seed.

Heliotropes should never be allowed to become completely dry at the roots.

Cayenne pepper or capsicum is very hard on caterpillars and other soft insects.

Chrysanthemums should have partial shade in summer, and a liberal supply of water.

Spireas require very little pruning if the flowers are carefully cut during the season of hlossoming.

A little fine dust lime mixed with soil will destroy many plant enemies and improve the fertility.—N. W. Horticulturist.

### FLOWER BORDERS.

Pansies, daisies, candytuft, sweet alyssum and oxtails are all good for low-growing horders for beds of taller annuals or perennials. Alternate spring-bloomers with summer and fall flowering plants in the border, and when one gets sleepy the other is just waking up.

It is one thing to plant a garden, and another thing to make the plants in it grow and mature in the hest way possible. The first essentials are good soil, good preparation, good seed, and proper planting. The last, but not the least, is good cultivation.

Experiment with flower novelties, but do not "hank" on them.

### PANSIES.

We take a wagonload of the well-rotted manure from last season's hotbeds for the pansy border, and such quantities of immense blooms as we do have! Pansies do better for me when sown outdoors in the fall or early in spring under glass, and transplanted to coldframes. House-sown plants always get "leggy" and spindly and suffer from "nervous prostration" when transplanted outdoors.

"A spray in time saves nine."

### WHOLESALE PRICES.

Producers have sometimes written the Cultivator inquiring the reason why their products when shipped to Los Angeles or San Francisco markets do not bring the wholesale prices which are quoted in the market columns. These products are usually consigned to commission houses, and it is thought that either the commission houses have dealt unfairly or that the Cultivator market quotations were in error. Either may possibly be the case, though so far as the Cultivator is concerned, we always endeavor to have the market quotations reliable guides for the producers. Occasionally when fruit comes into the market early in the season it is quoted at extremely high prices, and a few days only, will show a very decided slump. Also in the time between the securing of the market report appearing in the Cultivator and the time of receipt by the reader, there may be a material decline. Unfortunately, too, the commission man often plays the market to suit his own interests. Outside of these two factors, we wish to call your attention to the fact that wholesale market quotations do not assure the unknown consignor of securing any such returns for the fruit or produce he sends in. Should he go personally into the market, he would have hard luck in bartering to dispose of his product at the average rate for the day. When he sends to a commission house—if the commission house is an honest one—he should secure for first-class goods the top or at least an average of the market for the day. Then from these prices obtained must be deducted, of course, commission fees, freight or express charges.

With all these ifs in the way, it is not strange that the returns to the producer are often not satisfactory. The cry goes up almost daily; "What can we do to get honest returns for that which we grow?" This is a very hard question to answer, and the easiest solution we have ever been able to offer, and which we believe will ultimately prevail, is to be found in co-operation.

### EFFECT OF A NAME.

Under the title of "Not a Trust," the Cultivator recently referred to the Imperial Valley Melon Growers in an editorial in the Imperial Standard which said, "It is impossible to create a trust such as that of the orange men," and commented upon the statement of the editor, Mr. E. F. Howe, and maintained that the Citrus Exchange was in no sense a trust. At least we thought we maintained such a position. Now editor Howe comes back with this:

"The Cultivator grows interesting. We will not quarrel over words. One can call it a trust, an association, or what he will. But if it is not designed to boost prices its utility is not plai And if the result of union among producers of oranges is not to boost prices, it is not plain why cantaloupe men should follow their scheme. The Standard believes the cantaloupe men should be organized, but the point it made was that the cantaloupe growers cannot so well control output as the orange growers, because any packer can in a few weeks become a producer and break any combination."

We will fall back on Webster's dictionary, which says, "Trust—An organization formed mainly for the purpose of regulation in supply and price of commodities, etc.; as a sugar trust."

We repeat as in the former editorial, the Citrus Exchange is in no sense a trust. It does not attempt to regulate supply. We have not heard since the first very few years of its organization of its attempt to regulate the price. Its entire plan is to secure the top of the market, we admit, but since its abandonment of the F O B plan, we do not know of its having made an effort to boost or maintain prices in the sense which the sugar trust or other organizations have. For instance, it is common saying that if the Standard Oil is squeezed in any law suit or in any way meets with a loss, the price is promptly added to oil, which will cover such loss. Such a trust has absolute control of the product and can boost or maintain any price it sees fit.

If one cantaloupe grower finds himself handicapped by the fact that his crop is too small to give proper attention to its marketing and he joins with neighbor Jones and neighbor Brown and the three send to the market a competent man, who will market their product at the best possible price he can secure, they have not formed a trust, they are not boosting prices, they are merely meeting conditions actually existing and showing good horse sense. True, if they try to combine, control the output and boost the price and early in the season agree that every cantaloupe shall cost a certain sum, as the Standard said in its first editorial, there is nothing to prevent, on six months' notice, the commission men or buyers leasing a body of land and producing their own crop. But the fact that the growers are organized prepared to intelligently meet market conditions such as may exist when fruit is ready for such market, still leaves the producers in better condition to get best returns.

Now, the Cultivator objects to the use of the word "Trust," not only because it is incorrect, but because of the intense prejudice against the trusts and because of the sins committed by organizations under that name. We think the raisin growers and prune growers have both made mistakes in the past by organizing more nearly along the lines of the trust. That is, they attempted to fix a certain absolute price which every grower must stand by. We believe such efforts are in error; supply and demand should be allowed to regulate the price and when that is done, the producers do not run contrary to any law, neither do they run contrary to the prejudices of the trade, which resents efforts to arbitrarily fix prices.

### MORE SCARED THAN HURT.

The few hot days at the beginning of June made such a rattling of little oranges off the trees that a wail went up from all over Southern California that the coming orange crop would be a total failure. As in the case of the Eastern peach crop, this is very nearly a regular cry each year, though it must be admitted that investigations pointed to a more serious condition than ever prevailed before. At the time of the drop the Cultivator said that it would practically be the middle of July before anything definite could be determined. The middle of July shows quite plainly in many orchards that the crop will be far from a total failure. In fact, many growers are found who assert that the crop will be nearly as large as that of last year. The most pessimistic place the estimate at about fifty per cent of last year's. In any case the Cultivator believes that fully seventy-five per cent of last year's crop will be given to the state. If this prediction is made good, the condition is not by any means serious. At the time of the drop some growers maintained that not ten per cent of the normal crop would be given.

The point is that there is always an enormous quantity of fruit, more than the tree can stand up under, and much of it must fall from the trees. The heat this year coming after such long continued cool weather caused the drop to occur all at once rather than scattered over a period of several weeks, as is often the case. It is very probable that next year's crop will bring to California more profit than did that of this year. Present indications are that the fruit remaining will be of excellent quality.

### ASSOCIATION OF INSTITUTE WORKERS.

There will be held in Portland, Oregon, on August 16th and 17th the fourteenth annual meeting of the American Association of Farmers' Institute Workers. Reports will be received from institute workers in all the states and territories, and discussions of value to the workers will be engaged in.

The institute has come to stay, and the more information which can be passed on to the directors of these institutes, the better for the country at large. One question which we note is to be discussed is that of the practicability and advisablity of introducing prize contests along agricultural lines among adult farming people. Another discussion will be on the establishing of moveable schools of agriculture to be held throughout the entire year in various parts of the state.

### CONSERVATION.

The first conservation congress in the United States is to be held at the Alaska-Yukon-Pacific Exposition, Seattle, August 26, 27 and 28. With the dry farming congress, the irrigation congress, and the conservation congress before us, it looks as if a sentiment should be created which will mean much to the advancement of the West. It may seem that there will be a surfeit of "congresses," but the subjects in question are such that a little over-consideration is better than leaving the questions to drift as has been the case in the past.

### EVEN THE EAST WAKING UP.

Chicago does not seem content to remain in the background, and on November 27 to December 4 will hold a United States Land and Irrigation Exposition. This is for the purpose of giving authoritative information as to the best land opportunities in many of the western states.

This will be giving information where it is needed, for in many sections of the East little patience has been shown with the national reclamation project. Such education cannot but be of benefit to the entire country.

# Agricultural Notes of the Pacific Coast

## Northern California

From 86 Bing cherry trees one grower of Contra Costa county netted $2,500.

A new creamery has just been established at Hornbrook, Siskiyou county.

Willows, Glenn county, recently shipped an entire trainload of cattle at one shipment.

Marin county is considering the advisability of an extensive road improvement scheme.

A new drainage district containing 248,000 acres has been formed in Yolo and Sacramento counties.

Government and county inspectors of Humboldt county are engaged in dipping sheep for scab.

The Western Dairy Co. of Alameda has filed articles of incorporation with a capital of $25,000.

Nearly 2000 cars of deciduous fruit have been shipped for this season from Northern California.

Another company has been formed in Yuba county for the production of cheese from sheep's milk.

Over 5,000 acres of land will be planted to eucalyptus between Oroville and Biggs, Butte county.

Lumber shipments from the forests of Humboldt county promise to be larger than ever this year.

The California Fish Commission has distributed thousands of trout in the Truckee and its tributaries.

At the meeting of the Petaluma Egg Exchange report was made that on June 30th $4,500 was in hand.

An enjoyable day was spent by the members of Progressive Grange, Healdsburg, at its annual picnic recently.

Owing to large demands for its products, an alfalfa mill at Proberta, Tehama county, is running both day and night.

The board of supervisors of Siskiyou county paid bounty in June on a total of 179 coyote scalps at two dollars per scalp.

California Grape Growers' Association is planning for a large exhibit of wines and statistics relating to viticultural industry at the State Fair.

The Santa Rosa Chamber of Commerce is making selection from the finest fruit of that section and it is being processed for exhibition purposes.

The outlook for wine grapes this season appears dubious and it is feared the price of six dollars which prevailed last year will not be increased.

Gridley Colony Number Four, one of the newer colonies of Butte county, reports abundance of water and all kinds of vegetation doing exceedingly well.

The Chamber of Commerce of Oroville, Butte county, is making a display of products which have been grown on the dredged ground which has heretofore been called a "rock-pile" and considered of no value.

It is expected that by improvement in transportation to some of the mountain valleys of Butte county, impetus will be given to the raising of cherries in that section, which will ripen much later fruit than any now grown in the state.

## Central California

Farmers at Buttonwillow are planting largely of spinless cactus.

Delano, Kern county, recently shipped five cars of wheat in one week.

Canners seem very backward about naming prices for San Joaquin Valley peaches.

One grain grower near Porterville nets $10,000 from his wheat crop on 120 acres.

The government is installing telephones at various points in the forest reserves.

The Modesto cannery made a short run on apricots and is planning for a more extensive run on peaches.

It is estimated that the San Joaquin Valley will ship about a thousand cars of Malaga grapes during the season.

Marked success has been given an experimenter at Kerman in his efforts to produce a high grade of tobacco.

The Hanford Sentinel appeals for the establishment of a weather service for the benefit of the farmers of that section.

A grass fire starting on the Chamberlain and Carr Ranch near Hanford swept over hundreds of acres and did great damage.

The Santa Clara County Poultry and Pet Stock Association is making extensive preparations for its show on November 9th to 14th.

Buttonwillow, Kern county, is more or less interested in efforts of capitalists to secure a large body of land for a sugar factory.

The state shows an increase of nearly a million and a half pounds of butter for the month of June over the corresponding month in 1908.

The forest service contemplates establishing watch towers on the hills of the various forest reservations so as to secure early information as to fires.

Sewage from the city of Hanford, Kings County, has been used this year on some formerly worthless land and produced a magnificent crop of potatoes.

San Jose distributed cartons of cured prunes at the meeting of the Elks in Los Angeles last week. Their slogan in their advertising was Best Prunes On Earth.

The forest service is experimenting in seeding much of the reserve land with alfilaria which is so common over the deserts of California, Arizona and New Mexico.

The coming of the referee board appointed by Pres. Roosevelt to determine as to the poisonous effect of sulphur on dried fruit is awaited with great interest by dried fruit producers.

At the recent meeting of the retail grocers' association held in Portland, Oregon, Santa Clara Valley prunes were declared to be far higher in quality than those produced in Washington and Oregon.

The forest service will make various experiments near Fresno with methods of preservation of the common yellow pine to determine whether decay may not be prevented and that timber used for electric wire poles.

## Southern California

Los Alamitos Sugar Factory started slicing beets yesterday.

Coachella is sending out several cars of watermelons weekly.

Experiments are being made in beet culture in the Coachella Valley.

Antelope Valley finds abundant labor for all hands in its fruit and grain fields.

A district agricultural fair will be held at Arroyo Grande, September 20th to 25th.

Some of Coachella Valley vineyards boast of a yield of $500 per acre per year.

Orange county's output of sugar beets this year will aggregate over a million dollars.

Highland fruit growers are considering the advisability of holding a farmer's institute.

The Imperial Valley now has direct communication with Los Angeles by long distance telephone.

Authorities at Washington have merged the San Luis Forest Reserve with the Santa Barbara.

San Fernando Valley apricot crop will be a big one, but it is hoped sufficient labor is at hand to control it.

The grain crop at Canejo, Ventura county, is exceptionally good, one rancher reports forty bushels to the acre.

Growers generally maintain that the walnut crop will not be heavy but of fair proportions and excellent quality.

The output of beets at Chino this year will be so heavy that some of them will be shipped to the Oxnard factory.

The Union Sugar Co. at Betteravia reports the beet crop as excellent and the plows already turning out the beets.

Employes of the Chino sugar factory were given an old fashioned barbecue by the American Beet Sugar Company.

The chili crop of Orange county has been purchased at $22.50 per ton. It is claimed this will aggregate $150 per acre gross.

Santa Barbara county proposes to inaugurate a good roads movement which will involve the expenditure of hundreds of dollars.

The Mountain View Orange and Lemon Growers' Association at Upland claims that it has the best and most scientific lemon storage house in California.

The Alta Cresta packing house at Riverside makes the claim that in shipping 105 cars of navels, the deduction for decay on the entire amount was six per cent on ninety-three boxes.

The Southern California honey crop will not be so large as anticipated earlier, but the discouraging reports of the last few weeks have proved to be without foundation, as reports from various sections now show that at least a fair crop will be secured.

Thousands of acres of grain were burned at San Fernando, Los Angeles county last week. The loss was estimated at $125,000. Hundreds of farmers gathered and with mowing machines, rakes, and gang plows fought the fire until it was successfully controlled.

## The Coast

The first car of Yuma Valley cantaloupes went forward July 2nd.

Utah potato growers report the biggest crop ever grown in that state.

Yuma observes an annual feast of the melons which occurred this year July 1st.

The Spokane market reports abundance of California cabbages shipped to that point.

Troy, Idaho, reports the recent fall of rain as sufficient to guarantee this season's crops.

The farmers' union of Genessee, Idaho, has decided to buy a site and erect a large warehouse.

Farmers at Pasco, Washington, are uniting to secure water for irrigating about 4,000 acres of land.

The Secretary of the Interior recently withdrew over 500,000 acres of land in Idaho from entry.

The director of the Utah experiment station is making a study of pests affecting sugar beets.

The entire Spokane country, often known as the Inland Empire, reports the biggest crop of wheat ever harvested.

Preparations for the great irrigation congress to be held at Spokane August 9th to 14th are practically all completed.

Owing to good market conditions canners in eastern Oregon have failed to secure any cherries for canning this season.

Goldendale, Washington, reports six new combined harvesters delivered to grain growers of that section this season.

An immense irrigation scheme is under way in Texas by which it is hoped to reclaim over a quarter million acres of land.

Rains during the early part of July near Portland were sufficient to save the potato crop which was beginning to suffer from drouth.

A heavy rain falling for over 24 hours thoroughly soaked the lands near Pullman, Washington, causing the lodging of much wheat.

A big colonization scheme is projected for the northern part of Morrow county, Oregon, by which over 18,000 acres of land will be occupied.

Grain growers near Lewiston, Idaho, now hope for a reduction in transportation charges which will nearly cut the freight rate in two.

Poultrymen of Asotin county, Washington, have organized and incorporated and will hold their first poultry show December 7th to 11th.

A German expert investigating grape growing conditions at Pasco, Washington, reports that the Columbia River basin, in his opinion, "excels any grape growing section of the world."

The farmers' union of Colfax, Washington, recently discussed the handling of the coming crop of grain, and the first feature of the campaign was decided to be a canvass for new members.

The fruit growing lands around Colfax, Washington, will produce 125,000 boxes of peaches and 35,000 boxes of plums in the face of a claim of total fruit failure made earlier in the season.

**FOR MOULTING HENS**

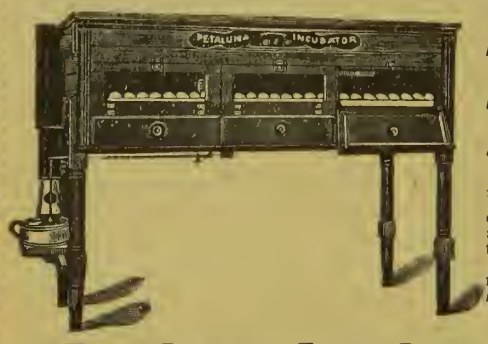
**Feed**

**MIDLAND**

**Poultry Food No. 4**

***$1.95 per Sack***

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.



***Petaluma Incubators and Brooders***

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Send for our Illustrated Catalogue.

**Petaluma Incubator Company**

**Petaluma, California**

Our General Agents for Incubators and Brooders and Midland Poultry Food:

**Petaluma Incubator Co., Petaluma, Cal.**

**Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles**

**Berrar & Robertson, San Jose, Cal.**

**Feed for Eggs Next Fall by Starting In Now with**

**West Coast Egg Food**

Don't make the common mistake of supposing that you can let the fowls get all run down before or during molting and then bring them up by heavy feeding later. You won't get eggs that way.

West Coast Egg Food has been the leader for many years. It is even better this season. We know how to make rightly balanced rations. That is our business. And we have the best equipped mill for doing it. No unsound grain, no mill refuse and such stuffs in ours.

Send for Biddy Booklet with many testimonials. Ask your neighbors, for there are more West Coast Poultry Foods fed in Southern California than all other kinds put together. If your dealer doesn't sell "West Coast" don't take others "just as good," but send to us and we will serve you right.

75-lb. sack, $1.90; 90 lbs., $2.25; 100 lbs., $2.50; 50 lbs., $1.30.

**West Coast Mill**

**Cor. Griffin and Alhambra, Los Angeles**

**Sept. 6th -- Big Hatch**

**Chicks, 10c and Up**

About that time we will be ready to ship all kinds of chicks we list in our catalog. Place your orders now if you wish to get chicks out of that hatch. Fall chicks make big money, and are easily raised. Send for booklet today, and order as soon as possible, so as to be sure to get them. We will sell

***One Million Chicks in 1910***

***Pioneer Hatchery Company***

***112 East Eighth Street, Los Angeles, California***

**A packing house on the Everest ranch, Riverside, recently burned destroying much packing machinery.**

The forest service has adopted a uniform for the rangers of the national forests.

# Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

## CHICKEN CHAT.

As the days grow warmer, don't get lazy and neglect those growing chicks. If you want some good, mature stock for prize winners, it is up to you to look well after their wants now. Fresh water they must have, placed in shady situation, and good food and plenty of it, if they are to grow that lustrous coat of feathers and lay on the necessary weight.

A dry mash of mixed grain and beef scraps should be always before them in a hopper, and green food fed daily, with grain also twice per day. Give them all the range you can with safety, and keep them and their houses free from mites and lice by frequent spraying, of the one, and dusting of the others.

Just as soon as the sexes can be distinguished, separate the pullets and place in a yard by themselves, and you will find it pays. Be very sure they have plenty of fresh air at night and that they are not crowded, providing broad flat roosts, and open front sheds.

If they are shy about learning to roost, don't try to put them up night after night, but place a hen or two with them, and they will soon learn the trick without loss of time or temper. And how proud they seem of the new accomplishment the first few nights!

The culls should be disposed of just as soon as a profit can be obtained, and rather than feed them too long, sell them at very little above cost, thus leaving more room for the better ones.

Feed green cut bone when it can be had fresh, but if doubtful, use more of the beef scrap.

Onion tops should not be thrown out, but should be chopped or ground up for the growing chicks and turks. It is said that onions fed plentifully are a preventive of lice, and that an occasional feed of sulphur is also a good thing, as it cleans the system of worms and germs, while it adds luster to the plumage, but must be used with caution when there are signs of rain. A teaspoonful of flowers of sulphur can be fed to a dozen growing chicks safely, and put in milk or mash.

There are to be some rousing shows this fall, and it is well to take time by the forelock and prepare ahead.—Mrs. Frank Metcalf.

## POULTRY QUERIES.

### Canker.

I am going to tell you of my experience with chickens with sore mouths. I had three hens and a Barred Plymouth Rock rooster get sore, cankered mouths. They seemed to be covered with a yellow substance and the odor was simply awful. I never saw anything like this, and I at once set to work to doctor them.

They all sneezed and seemed as if breathing was very difficult. I mixed lard and coal oil half and half and soaked head and back of bird and put some down each mouth. Then I took blue stone, quite a piece almost the size of a marble in a cup of water, and a cloth around my finger and held the bird's mouth open and cleaned it out every morning for ten days. I fed during this time, nothing but sour milk and table scraps. I saved all my chicks and it's now been a month since their entire recovery and two hens are laying.

I kept them entirely away from other fowls. No other shows any of this trouble. Did I do right in curing them? I have been informed it will break out again, and the offspring will inherit this disease. Is this a fact? Would you always kill the bird affected thus, and what is the disease?—Mrs. N. Weist, Imperial Valley.

This treatment seems to have been effective. For egg production for table or market, these hens will probably be as good as others. For breeding purposes we would prefer eggs from hens never affected with canker or similar trouble.

## EXPERIENCE WITH PEKIN DUCKS

The writer has perhaps had more experience in raising ducks than the average person, and will say that the large Imperial Pekin is the market duck par excellence, when well fed; but when half-fed (I came near saying half starved), he becomes a creature of no use whatever.

Some people will turn their little ducklings out to shift for themselves just as soon as they have gotten a fair start. They ought to know that a duckling isn't a gosling. One of our neighbors feeds her ducklings wheat as long as they survive. Another lets the little fellows snatch a bite from the chickens, providing they are quick enough, and so it goes. The result can easily be imagined little, stunted, hump-backed scavengers, whose beaks and feet have far outstripped their bodies in growth.

Now, there is neither pleasure nor profit in raising ducks by any such haphazard methods. Aim at perfection and don't be satisfied until it is reached. It is just as easy to raise good ducks as it is to raise good chickens, and, perhaps, a little easier, when one knows how.

The Pekin is a large feeder, this being his greatest fault. He does not necessarily require a large amount of grain, but something wholesome and nutritious, not too highly concentrated. Whole grain (with the exception of green corn, cut from the cob), should never be fed to young ducks. Ground grain is much better for both old and young. We sometimes feed soaked corn to matured ducks.

Cooked vegetables, thickened with equal parts cornmeal and bran, is a favorite duck feed here. If potatoes are used, the cornmeal and bran should be well moistened before it is added to the potatoes. When dry meal is mixed with cooked potatoes, a tough gummy mass is the result. The ducks may try to eat it, but the greater part is shaken out of their mouths and wasted.

Turnips, beets, cabbage, etc., are fed, but they do not contain starch as do potatoes, and therefore, no water need be used in mixing. In winter, when other green food is scarce, it is better to feed cabbage raw. Boiled oats, cut clover or alfalfa, either boiled or scalded, sometimes furnish the basis of the mash, instead of vegetables. Bran is an important factor in duck feeding. A duck will

seldom lose its appetite when housed in winter if plenty of bran is fed. Green food is also a prime factor in keeping ducks healthy. I prefer green rye to all other "greens."

We keep our ducks housed in severe weather. A Pekin duck cannot endure much cold. The floors are cleaned often and plenty of dry litter or straw is used for bedding. The water vessels are scalded every day and fresh water is given with every meal, and sometimes between meals. The water is always warmed a little in cold weather. And the grit is never forgotten, though never mixed with the feed. Coarse sandstone, broken fine, and coal cinders, are preferred to sharp grit. When grit is added to the feed, the ducks are sometimes forced to eat more than they require. Our ducks are fed enough to keep them fat the year round, for unless a Pekin duck gets enough to eat she will not lay many eggs, and besides they sometimes acquire a disagreeable habit of eating drift. Never feed or house ducks with other fowls. Add a little salt to their food twice a week.—Commercial Poultry.

### CLEANLINESS.

What to do in the way of cleanliness will perhaps be better remembered if a set of rules is laid down for the reader's guidance.

Provide a good dust bath for the fowls to wallow in. It is the best remedy for body lice. Paint the roosts once or twice with a good liquid lice destroyer. In early fall apply a coating of carbolated whitewash to the wood-work of the interior. It is an excellent lice destroyer and disinfectant, beside reflecting more light on dark days.

---

### A ROUP CURE.

Shut the chickens in the hen house and when they are all on the roost heat an old piece of iron (say a plow share or most any kind of iron), and when it is hot place it in the hen house and pour some carbolic acid on the iron, and the smoke that they will inhale will do the work. If the smoke gets too strong give them a little air. They will snuffle and make a noise, but this will do the work even if they are in a very bad condition.

---

The optimistic poultryman is the fellow who gets the most pleasure out of his venture. Everything looks bright to him, and, forgetting the hard knocks and disappointments of the past, he tackles the proposition anew, determined to win success in spite of all obstacles that may confront him. The pessimistic fellow, on the other hand, mopes around, not knowing whether to make another effort or not, and if he finally does decide to make another try, he goes about it in a half-hearted way that in itself brings on more disappointment and ultimate failure. It pays to be an optimist.—Commercial Poultry.

---

The poultryman who is making a profit from his poultry will no doubt see the importance of making poultry raising an industry which he is proud of and do all in his power to maintain and advance all lines of poultry raising. Poultry production in the United States has become one of the greatest industries in the world. In every section of the world chickens occupy the attention of many persons, some of whom are in the business for profit, others for pleasure.—N. W. Horticulturist.

---

Patient, industrious, untiring application, year after year, at any constant occupation, lends its assistance to success. Everyone that starts out in the poultry business will not make a success of it. Just so in every vocation of life. The wayside is strewn with wrecks. It has always been so and always will be, yet that does not prove that all kinds of businesses are failures. The cause is the man.

---

There is no better food for setting hens than whole corn, and there is no danger of their eating too much of it. It furnishes bodily heat and that is what is wanted. Aside from this, the setting hens must have good, sharp grit, plenty of clean water and a dust bath. An occasional feed of charcoal is good for them, too.

---

Hawks and owls to the number of 5,000, representing seventy species, were examined recently by an investigator. It was found that of this number only three, namely, the goshawk, copperhawk and the sharp-shinned hawk, prey upon poultry. When you go on the warpath, therefore, keep your eye peeled for these.

**Have You Tried Coulson's No 3 Condition Powders for Poultry?**

A first-class tonic and conditioner like ***Coulson's No. 3 Condition Powder*** is of great benefit to the chickens, especially when used at this time of year.

***Coulson's No. 3 Condition Powders*** will prevent diseases, by keeping the flock in a thoroughly healthy condition. By the same means it will keep them laying longer into the molt, and their healthy condition will enable them to molt quickly and commence laying at an early date. As it contains no injurious stimulant, it can be used with perfect safety at all times and for this reason is fed in large quantities by numerous poultrymen.

**It Contains No Cheap Filler**

In buying a bucket or sack, therefore, every pound is of value to the chickens, and will give you large returns for the money invested.

For sale by all dealers or at factory.

# IRRIGATE FROM YOUR OWN RESERVOIR

A reservoir on your own land makes you independent on the water question.

You will have no trouble in filling the reservoir during the spring rains, when all the streams, little and big are flooded.

Then you will not be at the mercy of ditch owners and other water users when the dry season comes.

The few acres you will require for the reservoir will not be wasted. They will serve to make all your other lands vastly more valuable.

## Raise the Water With An I. H. C. Gasoline Engine

Of course you cannot have your reservoir on your high ground. Locate it on the bottom land where it is easiest made and certain to be filled with drainage waters.

Then pump the water wherever you need it with an I. H. C. gasoline engine.

These engines, always powerful and reliable, have been found to be excellently adapted to irrigation pumping.

They are operated with little expense. They require but little attention.

They enable you to utilize the waste waters such as deep streams, sloughs and ponds upon your own land.

The farmer who has a water supply of his own, so that he may irrigate a few hours now and again, without regard to whether the water is flowing in the company ditch, is the independent farmer.

A reservoir on your own land and an I. H. C. gasoline engine to give you the water when you want it, where you want it, is the solution of the problem.

The I. H. C. gasoline engine can be used for other purposes beside pumping. It is a general purpose engine, which will be found an all around handy farm helper—to run grinder, sheller, separator, fanning mill, washing machine, churn, grindstone, etc. The I.H.C. line includes besides Famous pumping engines and jacks, the following:

Stationary engines, from 1 to 25 horse-power; Portable engines, from 2 to 20 horse-power; Skidded engines, from 2 to 8-horse-power; Tractors, 12, 15 and 20-horse-power, and Sawing and Spraying outfits.

Call on the International local agent for catalogs and all particulars in regard to these engines, or write nearest branch house.

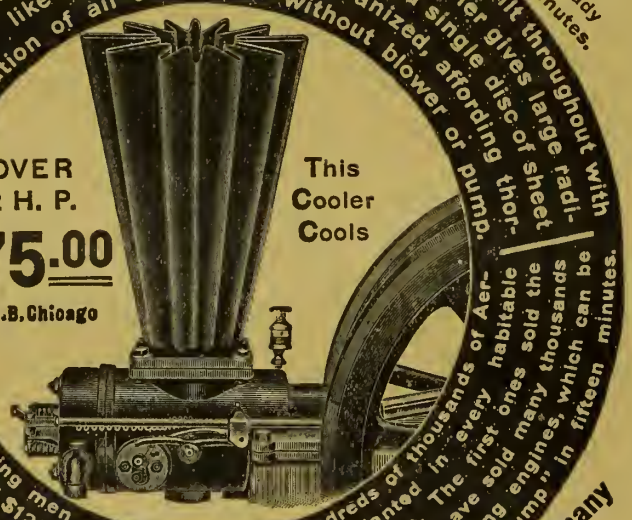
**CHICAGO, U. S. A.**

We believe we now offer for $75 the best 2 H.P engine made—built throughout with most painstaking care for those not expert. Its hopper cooler gives large radiating surface, in the best possible shape—made of a single disc of sheet steel, folded in like an umbrella, and galvanized, affording thorough circulation of air and water without blower or pump.

This gasoline engine, complete, on skids, with batteries, ready to start in 15 minutes.

OVER 2 H. P.
$75.00
F.O.B. Chicago

This Cooler Cools

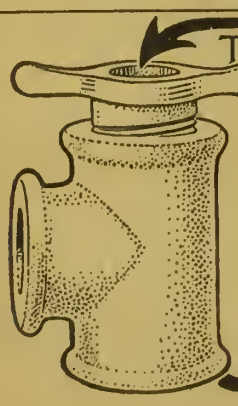


We employ no traveling men. The difference between $75 and $125, what others charge, is the cost of sending a man to induce you to pay the higher price. Aermotor goods are made so well that they sell themselves. Where one outfit goes others follow and "we take the country."

Many hundreds of thousands of Aermotors are planted in every habitable portion of the globe. The first ones sold the others. In a year we have sold many thousands of our little $37.50 pumping engines, which can be attached to "any old hand pump," in fifteen minutes.

If interested, cut this "circular" Ad. out and preserve it. It will not appear again

Aermotor Company Chicago Ill.



## The Tee Irrigating Valve

Simple in design and construction, costs less and will last longer than any other on the market.

The Tee Irrigating Valve is made of an ordinary malleable iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities.

There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.

A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.

Address **George C. Roeding, Fresno, California**

# Irrigation and Forestry

### JAPAN MAKES INNOVATIONS IN FOREST MANAGEMENT.

JAPAN is the only govenment in the world which takes upon itself the working of its lumber business, according to Consul-General Henry B. Miller, of Yokohama, in a report in which he quotes the director of the Japanese Forest Bureau.

The Mikado's government has set apart a quarter of a million dollars to build sawmills and lumber roads, manufacture lumber in remote districts, and put it on the market. Except railroad ties for Manuchurian roads the Japanese government exports no timber. It is all needed at home.

Many governments in different parts of the world own forests, but, as a rule, the timber is sold where it stands, and the buyer cuts and markets it. That is the way it is done in the National Forests of this country. The Japanese government, however, proposes to carry on all parts of the work, from planting the trees to selling the lumber after it has been manufactured. The report says:

"Recently an official in the department of agriculture and commerce was sent to the United States, and others to Europe for the inspection of the timber trade and forestry adminstration. A commission was also sent to India for the same purpose. A specialist on forestry in the same department is to be sent to South America shortly on a similar errand. The latter will thoroughly study the rubber plantations, and, if possible, bring back roots or seeds for planting on the Bonins and Luchu groups.

The Japanese department of agriculture and commerce, which established a sawmill in Akita prefecture in 1906, making a grant of $100,000 in that year and $150,000 in 1907, to develop the business, has obtained a vote of $150,000 toward the fund for the extension of the lumber business, and new government mills are to be established in Nagano and Aomori prefectures. Before the end of this year there will be nine timber mills in all in Akita, Aomori, Miyagi, and Kumamoto prefectures, all worked by the government. There is a very heavy supply of timber, but these forests are remote from railways, rivers, or seaports, and much expenditure is necessary for opening roads or constructing other means of transport in order to make such timber available.

District forestry offices will, however, not work mills regardless of profit, as strong competition is going on among them. It is stated that the government mills will only supply their products to merchants in Japan, and the works are not yet progressed to such a stage that the government can export direct. So far, the export of timber by the government mills has been confined to supplying sleepers to the South Manchurian Railway Company."

### REFORESTING BURNED-OVER AREAS.

An investigation as to the practicability of reforesting the great area of forest lands which have been devastated by fire and which are now lying barren and unproductive is now being carried on by the United States Forest Service in the Olympic National Forest in Washington. The area selected for the experiments comprises several thousand acres on the Soleduck River, and was at one time covered with a magnificent forest of Douglas fir. It was first burned over in 1890 and again in 1895. A third fire over almost the same area occurred in 1906, destroying the last remnant of the original forest, leaving the entire area treeless.

In some regions a second growth of trees will come in naturally after a burn, in the course of a few years' time, and where this happens artificial means of securing reproduction are not necessary. There are, however, other burns, where new growth does not come in readily, due to adverse climatic conditions, absence of seed trees, or perhaps to the impoverishment of the soil by repeated fires. These areas are often of very large extent and in such cases some means, such as planting trees or sowing seed, is necessary to restore the forest. The burn in the Olympic Forest is of this nature and the Forest Service is planning to conduct a series of experiments to determine the proper methods of reforesting the area. Douglas fir will be the species used.

It is believed that on the greater part of the area simply scattering the seed over the ground in the fall before snow falls or in the early spring will be sufficient to start a new growth. On other portions of the area, however, where a growth of grass and weeds has covered the ground, it will probably be necessary to work the seed into the soil by raking or dragging brush over the ground. In some localities sowing by what is called the seed spot method in which several seeds are dropped together in spots and covered with soil will probably be successful. To test these various methods five experimental plots have been selected. These represent the various conditions found on the burn, such as difference in slope, altitude, exposure, and vegetation.

This fall a large quantity of Douglas fir seed will be collected and a quantity sown on each plot. Next spring the experiments will be repeated and it is expected that the results obtained will indicate what methods and what seasons of the year are best adapted to the conditions found on this burn. When this is accomplished the Forest Service will be in a position to commence the reforesting of the Soleduck burn on a large scale and to re-seed large areas each year.

It is believed also that the results obtained will be of value not only in solving the problem of re-stocking the burn in the Olympic National Forest, but that much will be learned concerning the best methods of reforesting denuded areas on other forests throughout the Pacific Northwest, where conditions are similar, and that thus the work may be largely extended.

---

"To make farming without irrigation successful, a considerable percentage of soil moisture must be carried over from year to year. Fall or winter irrigation is advisable on deep soils with good drainage. It should be practiced in moderation. Summer fallowing conserves the soil moisture; the longer the fallow period, the higher the percentage of soil moisture. The reason why the beneficial effects of summer fallowing and fall plowing are not more evident in the soil moisture content is that the water capacity of most arid soils is small and that during the winter season a large portion of the water moves below the eight foot limit reached by the soil augers."

## MONEY IN BEETS.

An assured price for one's crop will be a big inducement to plant beets, the price of which is contracted for previous to even sowing the seed. Potatoes piled under straw in the fields, grain in stacks, and huge piles of hay under their board shelters testify in a mute but vigorous manner to a present lack of ready money; and until these crops are moved there won't be any capital for those to come. There isn't much satisfaction in raising a crop and then having it remain on one's hands as it has done this year. But infinitely worse is the planting of the same crops again with almost certain outlook of a stagnant market at the time of harvesting. And where is the money to come from that is to gather the crop?

The wise farmer will rotate with beets this year. Not only is he sure of his money, but he is helping his land. Grain year after year depletes the land and destroys the best physical condition.

Put beets in this year and you will not only be pleased but actually astonished at the difference it will make in your yield. The deeper plowing, the ramifying rootlets of the beets, and the increased cultivation will not only restore your land but it will rest it as summer fallow never can.

Rotation is the life of the land. It will hold off the day when fertilizers must be applied for a period of years, how long depending on the kind of crop raised, the length of time the ground has been under cultivation, and the strength of the soil in the first place. Rotation without fertilization is far ahead of fertilization without rotation. Especially true is this on our grain lands, where the plows run but four or five inches deep.

That rotation pays can be seen from Germany's experience. The Germans are very careful, methodical farmers, quick to follow new ideas when they grasp their importance, and always studying their soil and crop requirements. Even in their country, where every bit of land is farmed and crop rotation is an old story, they can increase their barley 25 per cent and their potatoes 100 per cent by following beets. We can increase these results very much here, where the soil is naturally strong and the methods employed pattern after the "by guess and by gorry" scheme rather than after scientific principles.

To convince yourself of the truth of these remarks try out a piece of land this year. Put fifty acres, or, if that is too much for you, twenty-five, or ten, or even five, into beets. Follow out the right method of growing. Plow deep, seed well and cultivate thoroughly. Do all the work on time.

Then harvest your crop and another year plant out your old standbys on this piece—grain, potatoes, corn, alfalfa or whatever it is—and you'll be certainly surprised at the greater increase in yield, the easier handling of the land and incidentally (and most important) you will prolong the life of your land, guaranteeing lifelong returns from it not only to yourself but to your children. Think it over.—R. L. Adams, Director Experiment Station of Spreckles Sugar Co.

## PAINTING THE OLD CARRIAGE.

Invest $1 in paint and back it up with a little elbow grease and you can put $10 or more value into your old carriage. I have painted several during my life with good results, and it is always a wonder to me why a man will drive a rusty old rig around when a little paint will make it appear fairly respectable, even when it is almost ready to drop to pieces.

I usually use a dull-finish paint first and follow it with varnish for a second coat. Wash your buggy clean the first thing you do, and go over it with sandpaper if you want a good job. Good paint can be had at practically all towns in the country. Let the first coat thoroughly dry before putting on the coat of varnish. In applying the varnish handle your brush with a light, sweeping motion, covering the surface rapidly and evenly. I have never found it advisable to attempt striping a buggy. I tried it once, but it detracted rather than added to the looks. The average farmer has not the facilities or the steady hand to stripe a buggy satisfactorily.

If you do not care to use this combination it is an easy matter to get paint which is already prepared with varnish in it. In that event one coat may be sufficient. I tried both ways, but prefer the dull finish followed with the varnish; the latter, of course, to put on the shine. A special paint or preparation can be bought for the top and dashboard, which is very effective. There is no great secret about painting a buggy, the greatest trouble being to get at it. Neither is it as big a job as some might believe. —New England Homestead.

## GUM ARABIC.

The most familiar objects about us are often the least understood, and probably few pause to ask the question, "What is gum Arabic and whence comes it?" In Morocco, about the middle of November (that is, after the rainy season), a gummy juice exudes spontaneously from the trunk and branches of the acacia. It gradually thickens in the furrow down which it runs, and assumes the form of oval and round drops, about the size of a pigeon's egg, of different colors, as it comes from the red or white gum tree. About the middle of December the Moors encamp on the border of the forest, and the harvest lasts a full month. The gum is packed in large leather sacks, and transported on the backs of camels and bullocks to seaports for shipment. The harvest occasion is one of great rejoicing, and the people for the time being almost live on the gum, which is nutritious and fattening.

## IMPORTANCE OF THE LEAVES FOR HAY.

One of the dangers to be guarded against in alfalfa hay making is the shattering of the leaves. Only two-fifths of the total weight of the alfalfa plant is in the leaves, yet three-fifths of all the protein is contained in them. In other words, 44 pounds of the leaves contain as much protein as 100 pounds of stems. Analyses show that the leaves are somewhat richer than bran for feeding purposes. Much of the loss of leaves ordinarily occurring during harvesting may be saved by proper attention to the curing operations.

### Sea-kale.

In a recent article in the Cultivator I notice you have a description of sea-kale and method of growing it. Will you kindly tell me where I can secure the seed?—X. Y. Z., Healdsburg.

Any seedsman advertising in the Cultivator can probably supply you with seed. We know that Morris & Snow of Los Angeles carry it. Concerning the growing of sea-kale we may add further information taken from Bailey's Cyclopedia of Horticulture:

"Sea-kale is a large-leaved, strong, cruciferous perennial, the young shoots of which are eaten in the spring, usually after having been blanched. The plant is little known in North America, but it is worthy of general cultivation in the home garden, for it supplies an esculent of good quality at a season when vegetables are scarce. Sea-kale demands a deep, rich and rather moist soil, in order to give the best results and to maintain its vigor for a series of years. The plants require about as much room as rhubarb; that is, they should stand from 3 to 4 feet apart each way. The culture and general requirements are much the same as for rhubarb. The young shoots are blanched as they grow, in early spring. The blanching is accomplished by heaping fine, loose earth over the crown of the plant, into which the shoots grow, or by covering the plant with an inverted box or flower-pot so that the light is excluded from the growing shoots. These shoots are eaten before the leaves have begun to expand to any extent, and whilst they are crisp and tender. The vegetable is prepared in the same manner as asparagus.

"Sea-kale is propagated by root cuttings, and also by seeds. Quicker results are secured from cuttings. If strong cuttings, 4 or 5 inches long, are taken in early spring and grown in strong and rather moist soil, the plants may be strong enough for cutting the following spring; but it is usually better not to cut them until two years from starting. The cuttings may be placed where the plants are to stand permanently, or they may be grown in drills in a seed-bed. The latter plan is usually to be preferred, since it allows the plants to receive better care. Seeds give plants that are strong enough for cutting about the third year. The seeds are really fruits or pods, and each fruit may produce two or three plants. Usually the fruits are sown without shelling. The seedings are raised in the seedbed and transplanted when one year old to permanent quarters. On good soil, plants of sea-kale should maintain their vigor for five to eight years after they have come to cutting age. As soon as they begin to show signs of decline, new plants should be propagated. Although the plant is hardy in the northern states, it is always benefited by a liberal dressing of litter or manure in the fall. (Plants may be forced in hot beds or under the green house benches, as recommended for rhubarb.) Sea-kale has large, glaucous, cabbage-like leaves which make it a striking plant for ornament early in the season. It also throws up a strong cluster bearing many rather showy white flowers. However, the plant is rarely propagated for its ornamental value. Sea-kale grows wild on the seacoasts of southwestern Europe."—L. H. B.

### Red Spider.

During the last two years we have had no late spring rains here and our prune orchards have suffered greatly from the yellow mite or red spider. My young prune orchard is from one to two years old. Last spring I sulphured it several times, but only got temporary relief. This year I experimented with three or four acres by spraying with Paris Green, one pound of Paris Green to 200 gallons of water, the Paris Green being first dissolved with water poured from slacked lime. The mite seems almost as thick as ever. It is very difficult to get the spray on the under part of the leaves, where the red spider is so numerous. My neighbor also sprayed his young orchard with Paris Green, but got no better results than myself. These orchards had winter irrigation, but are not provided with summer irrigation. Some of the owners of the older orchards are sulphuring with seed sower and one large orchardist is spraying with Paris Green. The young trees are much worse affected than the older trees. I am writing for myself and several of your subscribers. We are anxious to use the best method of fighting this pest.—Subscriber.

Spraying with Paris Green is of no value. In fact, the sulphur spray is of little value, for when the work of the spider or mite is observable the pest itself is probably dead and its injury to the tree accomplished. Paris Green is efficacious in destroying only those insects which eat of the leaves. The red spider is a sucker, i. e., secures his nourishment from the young growth of the tree by inserting a sucking tube. If dry sulphur of the best grade is not satisfactory, it is probably due to the fact that the cool weather or dense foliage have not allowed the sun to penetrate sufficiently so as to vaporize the sulphur. Possibly you would find the following solution more effective: Potash 32 pounds, best grade of sulphur 37 pounds, salt 2 pounds, water 50 gallons. This makes a stock solution, each gallon of which may be diluted with 100 gallons of water. The potash, sulphur and salt can be mixed together in a large metal tub with a little water, when chemical action will at once set in, the whole mass will dissolve and begin to boil. After the boiling has ceased, the remainder of the water can be added.

### Belgian Hare Questions.

What is the best food for Belgian hares? Do they need water? Will water hurt them? Do they need salt? How young should they be bred?—H. M., Morgan Hill.

There is no one best food, as, like all other animals, they need variety. Grass, hay, oats, barley, rolled oats, wheat, bread, vegetable waste, roots, branches of trees and shrubs, fruit; in fact, anything the wild rabbits eat—taking into account, of course, the difference between a state of nature and the condition of an animal confined to a small space.

Certainly they need water. They can live a much longer time without it than most animals, particularly if fed succulent food, but they greatly enjoy a drink of cool, clean water; and so far from hurting them, its absence causes intense needless suffering. I have never known a mother to devour her young—a very common complaint—if she had plenty of good cool drinking water at kindling time.

Like all herbivorous animals, salt is an essential, yet they use very little of it. The best way to give it is to put a lump of rock salt in the hutch where they may get it at will, or fasten a small box containing salt to the wall of the hutch.

They may be bred at four months, but we never bred much under a year, as we desired fine stock. The litters are larger, stronger and in every way better from matured mothers than from stock bred too young.

Those who have breeding stock to sell have drawn pictures, rather out of perspective, of the requirements of hares. The truth is while they are amply able to care for themselves in a wild state, as we know too well, when they are domesticated and confined that ability is, of course, removed, and must be supplied by close attention on the part of the keeper.

They must be clean, judiciously fed with a variety of wholesome, suitable food, and must be bred with discretion. The persons who have been led to believe that they need only any kind of a pen, anywhere, any kind of food thrown in at any convenient time, a surfeit today and none tomorrow, are respectfully asked, for humanity's sake, to buy some cotton flannel and make your rabbits. It will be just as profitable and much more humane.—Bee Josephine O'Mealey, Kanova Ranch, Anderson.

### Amount of Water for Irrigating.

I have seen it stated that on a sandy soil a depth of two inches of water should be the maximum required to fill the first foot if applied every thirty days. Is this correct? Also is sub-irrigation successful for grass plats and vegetable gardens? If so, what is the best material to use for under-ground flumes? What dimensions should they be and how far apart should they be placed and at what depth? I am told that sub-

AMERICAN STEEL PIPE & TANK COMPANY
FORMERLY TALLERDAY MANUFACTURING COMPANY
636-7 Pacific Electric Building Los Angeles, Cal

irrigation is successful in Colorado. Of course I am aware that it proved a failure in the orchards of this state.—W. C. V. P., Redlands.

The amount of water required for best results depends so much on soil and sub-soil conditions, the crop and manner of its handling, etc., that it is impossible to give any arbitrary rule. One crop may require ten times the amount of water that another will. In a general way, though, it may be said that two inches should be sufficient if properly handled and if the subsoil is moist, not having lost its moisture through lack of cultivation.

As to sub-irrigation, we do not think a successful plant has ever been maintained for any length of time. In theory, and in practice for a short time, it is all right, but as the inquirer says, it proved a failure with orchard trees, and the same crowding of roots into the underground pipes would prevail in garden work, though to a lesser degree, and of course there would be intervals when no roots would be growing into the pipes. But the sub-irrigation plants are so expensive to install that we doubt if the results would justify the effort. However, it is a most attractive question, and we ask our subscribers who have had experience to write as to methods used and results. There are some modifications of sub-irrigation, such as the sinking of cans in the soil at certain distances apart. These cans are perforated and surface ditches run from one to another. On steep hillsides this method of irrigation has proved very successful. Let our subscribers give us further information.

### Seed Bed Stock Dying.

Can you give me any information as to orange seed bed stock dying off? The sweet seed is far worse than the sour, which was planted two months earlier in the spring than the sweet.—Subscriber, Hemet.

There might, of course, be a number of causes for seed bed stock dying: Too much water, too little water, water irregularly applied, or improper soil conditions. If the seed were sown properly and covered with a layer of soil topped with a layer of sand, then kept properly moistened, there is no reason why they should not do well. From the fact that the sour stock is doing better than the sweet, our guess would be that too much water has been applied and the seed or plants have decayed.

### Preventing Potato Scab.

Please give recipe for solution for preventing scab in Irish potatoes. How long should they be soaked and how soon after soaking should they be planted?—E. S., Turlock.

Immerse them two hours in a solution of formalin of the strength of one pound to forty gallons of water. The seed may be planted at once, or if not, should be spread on the floor to dry off. They should be planted in soil which has not grown scabby potatoes. Some prefer to use a solution of corrosive sublimate, one ounce to six gallons of water. Immerse the whole tuber an hour and a half in this before cutting.

The Harvey Spring Co. of Racine, Wis., has just issued a neat little circular setting forth the advantages of their bolster springs. It contains some good illustrations and testimonials from satisfied customers. Every owner of a farm wagon should have one of these bolster springs, as they are a great saving, not only to the wagon, but to produce which is being marketed. Those who have tried them say that they would not do without them if they cost twice the money. The circular will be sent free to anyone writing to the Harvey Spring Co., Racine, Wis., and mentioning the Cultivator.

## Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Mange.

My horses I think have the mange. The skin is sore and rough, itches badly, and the hair is coming out in spots. What is the best remedy?—W. V. H., Porterville.

Make a solution of two ounces of formaldehyde in one gallon of water. Apply this to the affected parts daily with brush, rubbing it well in. Feed alfalfa hay exclusively, with enough grain so that the horses can do their work.—R. T. W.

### Lump On Jaw.

I have a cow that has a lump about the size of an egg on the side of her jaw. It grew very suddenly and I cannot account for it unless the horse kicked her. Is there anything I can do for it?—Subscriber, Douglas, Ariz.

This may be due to kick, as you think. If so, cut it out and treat with any antiseptic wash. Carbolic acid and water will do. If it does not heal, treat for lumpy jaw. Make a solution of potassium iodide, one pound, in one quart of water. Give dose of half ounce night and morning in the feed. —R. T. W.

### Worms.

My little dog coughs and chokes. He eats well, but is growing poor. I think perhaps worms come in his throat.—C. J. G., Huntington Beach.

The trouble is probably worms. Give a dose of twenty drops of turpentine in a teaspoon of olive oil three times daily. Give a strong salt water enema (saturated solution) once daily for two days, all he can possibly retain.—R. T. W.

**DR. WHITTLESEY'S VETERINARY REMEDIES.**

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Cellar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

## SCHOOL OF AGRICULTURE.

The State University Farm was purchased with the intention of using it for giving instruction in agriculture. The Farm is serving this purpose in the largest possible way, since the same plant is being used in three different courses—the School of Agriculture during eight months of the year, the "Short Courses" for farmers given each fall and certain courses of the College of Agriculture. Students of the School of Agriculture receive their technical instruction from members of the faculty of the College of Agriculture. Thus while a boy who attends the School of Agriculture may not have as thorough or extensive a course as he would at college, he works under many of the same men, who are not only specialists in theory but men of wide practical experience as well. For example, the work in Horticulture and Viticulture, in Animal Industry and Veterinary Science, in Dairy Industry and in Poultry Husbandry, is similar to that in the College of Agriculture; and the same extensive appliances are available to make the instruction practical and valuable. In the Dairy course the students actually do the work of milk testing and butter-making; an orchard and vineyard are at hand in which to learn the principles of pruning and spraying, and the various branches of fruit production. A dairy herd, beef cattle, horses, sheep, swine and poultry, all are part of the equipment of the Farm, and used in the courses of the School of Agriculture. An Experiment Station is located on the Farm, and students are encouraged to watch the progress of the experiments, and to undertake experimental work of their own, in lines in which they are interested. The boy who cannot go to college may thus have a scientific and practical course in agriculture under first-class teachers. The School will open September 20th; a circular of information may be had by applying to the principal at Davis.

## FARMERS' NATIONAL CONGRESS.

The 29th annual session of the Farmers' National Congress will be held at Raleigh, N. C., beginning November 3. President Cameron has secured a number of excellent speakers of great ability and reputation.

The Farmers' National Congress is the only national agricultural organization existing exclusively for considering broad national agricultural questions and expressing the wishes of the farmers thereon. George M. Whitaker, 1404 Harvard street, N. W., Washington, D. C., is secretary.

Kerman shipments of cantaloupes have already begun. There are 250 acres in the district.

## Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

## THE PLEA OF THE CITY ELM.

Long years, a watchman of the woods,
I grew;
The sanctuary of a thousand birds.
Sweetly the cardinal whistled, flashing bright,
Amid my springtide leafage; from my crown
The thrush at morn and eve breathed heavenly prayers;
The merry robin chose me for his nest,
And warred with barking squirrels for his rights.

Then came a day of ruin. Right and left,
The spicy woodland smoked; my comrades lay
Prey to the axe. The busy hands of man
Built in our ancient realm a human home.
I only left, with mutilated roots,
And crippled branches, strove to bear myself
As worthy warrior of the ancient world.

I sheltered with my boughs this human brood;
The children laughed to see the squirrels race
Along my rugged trunk; still, in the spring,
The piping oriole glanced from twig to twig,
And painted bluejays cheered the winter hours.
How grateful was my shadowy green in heat!
And all the year beneath the sun and moon
My boughs drank in the common fainting air,
That, by the secret power vouchsafed to me,
I breathe back ever to refresh the world,
Purified, and with healing in its wings.

But now, a weary state is mine. A swarm
Of smoking roofs surround me; noxious airs
Arise from every side; my roots are pent
In case of stone, and no enriching soil
Is given to feed them; scorching winds and dust,
Through the long summer days, my tender leaves
Shrivel and clog; and bring with them a blight
That kills off branch on branch. Even the weight
Of burdensome dead wood they spare me not;
And yearly weaker I, and stronger death.

Man sways my fate, for men my life is given.
Well have I served, and many years might serve.
Must I thus pass, neglected, from my post?
No longer look upon the silent stars,
And breathe the joyful sunshine, gathering thence
Strength for my sweeping limbs, my traceries
Of winter twigs, my burst of springtide bloom,
The summer glory of my towering green,
My shadowy cool, my power to bless mankind?

O, Master, generations yet to come,
Shall they enjoy the wholesome good I give?
Oh, hear this timely plea, and help the sum
Of long years' growth; help noble beauty live!

—Marian Mead, Chicago, Ill.

## MAY FLOWERS.

BUTTERFLIES, rainbow and tinsel, with thought only for the present moment, pleasure to the eye and senses," murmured Miss Ratcliffe more to herself than to the professor. There was no envy in her voice, no sarcasm, only just philosophic speculation with perhaps a little wonder. And in her eyes was the same expression as when analyzing a new bug.

The professor regarded her admiringly, respectfully. There was much the same look of impersonal wisdom in their eyes, and much the same network of fine, studious wrinkles gathering along the base of their brows. They had delved into the depths of knowledge for exploration's sake. And both were comparatively young, with untaxed strength and untried fields ahead.

But as the professor's gaze followed hers through the window to the butterflies and tinsel, there was an unusual wistfulness in his eyes. Miss Ratcliffe's profile was Grecian, without flaw. The professor never felt any scholastic diffidence in her presence, but was always calm and self-contained, as when immersed in his studies. But as his gaze followed her out to the gayly-dressed girls swinging about the maypole, something very like longing showed in his eyes.

"They are very happy," he said; "very happy and joyous and bright colored, like butterflies. But they are young ladies now, and Miss Carlton is 20, I believe. The butterflies are irresponsible, however, and meaningless joy is their mission. But some of them have unusual ability, as Miss Carlton; and precious time is consumed in arranging tableaux and romping and swinging around a pole like that."

"Miss Charlton has been the mainstay at her home, I understand," said the professor gently; "and I am told she earned the money to come here herself, by working in a factory."

"Yes," regretfully, "she is a girl of much force of character. That is why I deplore the scene out there. Life is not long enough to learn all that every one ought to know, and with Miss Charlton's abilities the idle hours could be made to yield a vast store of knowledge for either personal satisfaction or an extra means toward a livelihood."

"Sometimes I have felt lately that our lives may have lacked some of this color and idleness, and—and fun," the voice still gentle. "Of course, we could not change our lives even should we desire; but I—I think a little color added might make us happier."

"I have not felt that way at all," returned Miss Ratchliffe, thoughtfully. "Moreover, I feel that, as head of the school, Professor West ought to go out and speak to the girls. They all have a strange liking for you, and would listen where they would to no one else. It is a crucial time in their lives, and no better opportunity could be had to advise them than now, while they are dancing and singing around the pole, covered with their May flowers. Really, it is a duty with you professor."

Professor West rose reluctantly, an unmistakable color now in his face.

"Well, if you really think so, Miss Ratcliffe," he said, "I—I—of course the school comes first."

As he crossed the lawn, the whirling girls paused for a moment to catch their berath. Then they caught sight of the handsome, strongly-built figure coming toward them, and several of the girls started forward. Miss Charlton alone did not advance. She was standing by herself a little to one side. Professor West spoke a few words with the others, then went straight to her.

"I—I would like to say a few words to you, Miss Charlton," he began. "All this color and gayety and—and fun out on the lawn, where everybody can see seems," as the color began to rise in her face, "er—very nice, and I like it. We need more color and fun in our lives, and you have been very good to us in this way since you came. I—I am out here to thank you. My life has been very colorless, so far, and lately I—I have thought——" He was beginning to flounder again at something he saw in her eyes, and added. "I would rather have some of your joyousness than anything else in the world, and— and, will you be my wife, Margie?"

"Professor West!" The girl started and drew back; but he saw it plainly in her eyes now.

"You do love me?" he said eagerly.

"Y-es, but I—I am not fit."

"It is I who am not fit. I am too sober and plodding. Will you be my wife?"

"Of course," simply, "if you want me."—Spokesman Review.

# About the House

WHERE one is fortunate enough to have a bath room and sink in the house, much is gained to health by keeping the run clear of obstruction, with an occasional flushing of hot soda water.

Look after the refrigerator closely now, for it may prove a very dangerous article unless it is properly cared for. Bits of spoiled meats and vegetables breed the germs of typhoid and many other deadly diseases, and a careless or hurried servant is liable to overlook the timely removal of such offensive and dangerous agents.

A good remedy for summer complaints or dysentery is made with one tablespoon level full of wheat flour and an equal amount of pulverized cut loaf-sugar, mixed with enough good brandy to make a stiff dough, and do not mix more than this at a time as it must be used fresh. Take a half teaspoonful of this every half hour until relieved.

If you want an excellent toilet powder to use for heat, perspiration or any skin irritation, you can make it yourself and it is much cheaper and better than any you can buy ready prepared. Buy a pound of plain starch, crush it fine and sift through thin muslin, then add a little soda and a large tablespoonful of borax, mix well and keep in a talcum powder can. This is excellent for perspiring hands or feet, and the disagreeable odor from perspiration will be instantly removed, as borax is a deodorizer and an antiseptic.

If you suffer with tired and swollen feet after taking long walks, sprinkle half a teaspoonful of boracic acid powder inside the sole of each shoe before starting out; this absorbs the dampness and keeps the feet in good condition. If the feet and hands are inclined to be moist and tender they should be rinsed frequently in cold water in which a little alum and powdered borax are dissolved, and if this solution is applied to the face before going out in the sun and allowed to dry on the skin, it will prevent tan and sunburn, and if one enjoys going out in the sun and air, tan and freckles are a natural result unless some precautions are taken.—M. A. Y.

"I believe in work, hard work, and long hours of work. Men do not break down from overwork, but from worry and dissipation.—Gov. Charles E. Hughes."

### DRY CLEANING.

Dry cleaning at home is almost regarded in the light of a hobby by many women. A word of warning is, however necessary at the outset before dry cleaning by means of gasoline is commenced.

Few chemicals which are within the range of the amateur are more explosive, and a large quantity of the gasoline should never be kept in the house if possible, nor should the cleaning process be carried on where there is artificial light.

Until the garments cleaned are thoroughly dry they should not be placed close to an open stove or fireplace. When possible the whole process should begin and end in daylight.

To clean blouses of silk, crepe de chine, or other materials, an earthenware or an enameled jar or pan with a cover should be used and kept strictly for that purpose.

The article to be cleaned should be placed at the bottom and covered with gasoline and the lid put on. After twenty-four hours the jar may be opened and the blouse gently squeezed with the fingers until all the dirt is removed.

The gasoline should then be poured off into a bottle and placed with the rest of the spirit, and after twenty-four hours may be used again, the liquid being poured off slowly without shaking, while the dirt remains in the form of a sediment at the bottom of the bottle.

### THE HEALTH FAD.

Christian Scientists cure disease by denying its existence; the mental scientists deny that the Christian Scientists are right; the vegetarians arrive at purity by means of a selected diet; now the Episcopal Church, perceiving the drift of things, sends out its healing missionaries. And they all, whether they be Christian ministers or red Indian Shakers, accomplish in individual instances what they essay. But through the publicity of such healing they do still more, thanks to the subtle power of suggestion. The results of their achievements blazoned everywhere by the press keep the minds of plastic and unstable people on the alert for some new symptoms, some fresh unhappiness, or source of fear, and the question frankly faces us if by these means disease is not created faster than it can be cured. Health is a dangerous topic for those physically healthy. In searching for it, one often loses it. Its persistent consideration dilutes the joy of living and nurtures invalidism, and thereby strikes at our power to love and benefit mankind. It must have been the observation of some sect of hypnotized seekers for personal health and individual happiness that led Stevenson to write: "Whether we look justly for years of health and vigor, or are about to mount into a bath chair, as a step toward the hearse, there is but one conclusion possible; that a man should stop his ears against paralyzing terror and run the race that is set before him with a single mind."—Appleton's.

### THE REAL THING.

"My furs are like those," exclaimed little Louise, while walking through the store.

"Why," exclaimed her mother, 'you have no furs of any kind!"

"Yes, I have," protested the child, "and they are lined with kittens, too."—Lutheran Observer.

**A Special-Value Lantern**

Liberty Lanterns are worth more in actual service than any lantern made and don't cost a penny more.

**Liberty Lanterns**

give the broadest, strongest, whitest light. They won't jar down or jolt out. The bail stands at any angle. A strong coiled spring holds the globe steady. The globe is the thinnest, toughest chimney glass made. Don't be persuaded to buy the "just as good" kinds. Buy the best—Liberty Lanterns.

**Angle Lamp**

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Beeswax per lb .....24@28

### Hay.

Scott & Magner say under date of July 17:—Receipts of hay on the San Francisco market for the week ending today have amounted to 3700 tons, which is a little increase over the shipments of the previous week.

Fancy wheat hay, of which only a few cars have arrived this week, have commanded our topmost quotations, but on all other types of hay the movement has been slow, quiet, and much difficulty has been experienced in moving off the bulk of the hay from the cars in time to save $6.00 per day car demurrage.

A little hay has been moved off for foreign shipments, but it is nearly impossible to hold this trade in competition with the northern prices, on account of the high prices prevailing in this market.

Alfalfa hay has been arriving in small lots, and as the demand is not brisk, sales of alfalfa hay have dragged somewhat, although the market is practically unchanged.

What straw has come in during the week has been satisfactorily disposed of, and the market on this article at this writing can be quoted as fairly steady under a light demand.

This week's quotations are:
Choice wheat hay .....17.50@18.50
No 1 wheat or wheat & oat 16.00@17.00
No 2 wheat or wheat & oat 14.00@15.50
Choice tame oat .....16.50@17.50
Other tame oat .....13.00@14.50
New crop wild .....12.00@15.00
Stock hay .....8.50@10.00
Alfalfa .....10.00@14.00
Straw .....60@75

### Grains.

Wheat No. 1 .....2.07½@2.12½

Middlings .....33.00@35.00
Mixed feed per ton .....26.00@30.00
Shorts .....31.00@32.00

## Citrus Market

LOS ANGELES, July 21, 1909.

The orange market remains in fairly good condition in the far eastern points while the general tone west of the Mississippi is exceptionally good. That is, this is true as to Valencias. A small quantity of sweets, seedlings and other than Valencias, is still going begging and bringing practically nothing to the grower. A few sales have been made that have not brought freight and packing charges, but as a rule there have been but few red ink returns. Fruit is going forward very rapidly and a clean-up is expected before the end of the season.

The lemons are not as much in demand as a few weeks ago, but the price is yet much better than a year ago at this time. Shipments from the state have been exceptionally heavy and there are at this writing more than forty thousand boxes afloat in excess of same date last year. Notwithstanding this, exceptionally good fruit will bring $4.00 to $5.00 f.o.b. local points. Some indifferent fruit is meeting with poor demand and sometimes barely brings charges.

### Shipments.

Total shipments of citrus fruits to date this season are 33,139 cars, of which 28,219 were oranges and 4,920 were lemons. To same date last year, 26,522 cars of which 22,748 were oranges and 3,774 were lemons.

---

NEW YORK, July 16.—Eight cars oranges sold. Market firm on good fruit. Weather hot, cloudy. Threatening rain.

## SUGAR BEETS AND BEET SUGAR.

Though sugar can be extracted from many plants, the world's supply of sugar comes at present from only two plant species, sugar cane and sugar beets, and it comes about equally from each. The former is grown only in tropical or subtropical climates, the latter only in temperate climates.

The great bulk of the beet sugar consumed is made in European countries, Germany, Russia, Austria-Hungary, and France being the leading producers. But in recent years the young and rapidly growing beet-sugar industry of the United States has come into prominence. There are now 64 active beet-sugar factories in this country located in 16 different States. Last year the farmers of these States harvested about 365,000 acres of beets, and delivered to the factories 3,415,000 tons of beets. From these nearly 426,000 tons of refined sugar was made, the yield of beets per acre was 9 1-3 tons, and the yeild of sugar per acre of beets was 2,334 pounds.

The U. S. Department of Agriculture has just issued its annual report on "Progress of the Beet-Sugar Industry in 1908." One marked feature of progress is seen in the improved quality of the beets grown. The entire beet crop for 1908 averaged 15¾ per cent of sugar in the beets. The factory processes have also been improved until the refined sugar produced is about four-fifths of that contained in the beets.

One of the instructive features of this report is an account of the use of by-products. The beet pulp from which the sugar has been extracted is a valuable stock food, and vast quantities of it are fed in the fresh state to cattle and sheep. If finds especial favor with dairymen. A dozen or more factories have installed plants for drying pulp. With this is mixed molasses, the product being put on the market as "dried-molasses-beet-pulp." The molasses is also extensively used in the manufacture of alcohol.

The prospects for further development of the industry are reported to be good. Plans are on foot for the building of several new factories.

## DRY FARMING.

Dry land farming in order to succeed, means better farming, says Campbell's Farmer. Where the work is done intelligently and diligently and at the right time there are too many shining examples of splendid harvests on dry lands to warrant the opinion that they can not be successfully farmed. To make these lands produce good crops observe these points:

1. Water is essential.
2. You can store water by tillage.
3. Seven to ten inches more water is found beneath a surface which has been summer tilled than beneath an untilled surface adjoining.
4. Plow five or six inches deep.
5. Harrow immediately after plowing before the furrows dry out.
6. Keep a dust mulch by harrowing during the summer. Don't let weeds grow and waste the soil water.
7. Harrow the grain in the spring.

Humus in the soil indicates, in a large measure, its fertility. This is especially true of sandy soil.

## SPONTANEOUS COMBUSTION OF HAY.

When alfalfa hay is stacked or put away in the barn too green it is apt to heat and may in extreme cases become so hot as to take fire and burn. In such cases care should be taken to admit no air into the heated mass, which will then be unable to burn for lack of oxygen. If this heating process is not carried too far it results in what is known as brown hay. In this form it is still well relished by stock and apparently loses none of its feeding value.

Cotton planters in the Imperial Valley will be putting seed into the ground until the end of this month. One rancher in the Valley will plant 220 acres of cotton this season.

## SHEEP SCAB AND ITS TREATMENT.

In a recent issue of the Cultivator there appeared an article by a Missouri writer, containing various formulas for dips, all of varying degrees of difficulty of preparation, and in the same article reference was made to certain dips which had been offered to the trade in "this state" which had been found inefficient. The credit for the article was given to the Missouri writer, but thinking perhaps the words, "this state" might convey the impression to our sheep breeders that the state of California was referred to, we wish to state that while that may be true of the state of Missouri, in our own state there are some excellent dips offered by the trade. One we have in mind, which has been given every test and proven effective, is known under the trade name of "Germfoe," a positive germ destroyer, antiseptic, disinfectant and insecticide.

It is made of coal-tar oil. Such dips are the very best: the most effective and perfectly harmless. The wool is improved by their use; as they not only cleanse but leave no stain and give a soft texture. Caution must be used with carbolic dips and those that contain petroleum; also with sulphur-lime and tobacco dips. And none of these dips can compare in effectiveness with coal-tar dips.

But such dips differ very much. A coal-tar dip depends for its activity upon the cresylic acid it contains. Germfoe is absolutely guaranteed to be made from an imported oil containing 25 per cent cresylic acid. Most dips sold in the United States are made from domestic oil and they run about one-half the strength of the imported, although great claims are made for them. Germfoe has been approved by the U. S. Dept. of Agriculture for the treatment of sheep scab in the proportion of one part Dip to 69 parts water. This is one of the highest dilutions permitted by the Department.

This product has been advertised by the West Coast Mill Co. of Los Anegles, and by it has been placed on many ranches of California. The firm is so thoroughly reliable and so guarantees its product that the Cultivator feels safe in assuring its readers that this particular article, "Germfoe," is most thoroughly effective.

## MUTUAL INSURANCE ASSOCIATION.

On another page appears the advertisement of the California Mutual Live Stock Association, whose general offices are at Oakland. Their references and depositories are The First National Bank of Oakland and the Security Savings Bank of Los Angeles.

Among the reasons advanced by this company for live stock owners to insure with them is the fact that it is the only institution of the kind organized under the laws of California with a home office in this state. They insure live stock against death from disease, fire, lightning, tornado, cyclones and every casualty; also through accident which may necessitate the death of any animal. Losses are paid promptly without discount and without delay. The company has a guaranty deposit with the state treasurer for the protection of members and policy holders. No dividends or profits are paid to idle office holders. The business of the Association is conducted as economically as is consistent with good management and the earnings are divided among the policy holders.

This is an age of mutual insurance and the strongest and best companies are composed of and managed by the policy holders, as has been demonstrated in the East. Look over the list of claims paid. Write some of the parties and also write direct to the company, 610 First National Bank Building, Oakland California, for specimen policies, information and cost of insurance. Mr. M. L. Wright, the president, will cheerfully furnish full details and application blanks.

## AMES PUMPS.

The finer illustrations from Catalogue No. 24 issued by the Ames Manufacturing Company of Niles, have been taken and made into a wonderfully attractive pamphlet. They show the Ames Pumps at work and the various parts of the pump head which has practically revolutionized the system of deep well irrigation. The Ames Company was formerly located at Galt between Stockton and Sacramento, but is now at Niles with a magnificent new plant which is capable of putting out a greater number of pumps and of better quality than ever. We doubt not that Mr. Ames is still making the leather packing supplies for which he is justly noted.

Farm of J. R. Milne, Grower & Shipper of Fruit, Forbes, Holt Co., May 19th, 1909.

Fort Dodge Chemical Co., Fort Dodge, Iowa:

Enclosed find P. O. Order for $1.50 to pay for one package of Gopher Death and one of Raticide Tablets. I have been fighting gophers for 28 years, have tried about everything and find your Gopher Death is ahead of all else for ease of application and certainty of execution.

Yours truly,
J. R. MILNE.

**What is the Market Price of Your Produce Today?**

60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it fails to do this, **any** money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

# Character and Control of Hardpan

## A Paper Prepared by Charles Fuller of Redlands in Competition for a Prize at Pomona College

THE subject of hardpan has been greatly neglected by agricultural students and writers. Whether because it has never been fully understood or whether it has been deemed of too slight importance, it has not received the attention which it merits. As a matter of fact the study of hardpan is of the greatest importance to the owner and tiller of land in California for the phenomenon is encountered in almost every district and presents problems which demand satisfactory solution. What is the constitution of this hardpan? What is the reason for its periodical appearance and disappearance? What is the means of preventing its formation? These are the practical questions which at once confront the inquirer.

The constitution of hardpan depends primarily upon the nature of the soil. Those soils which are largely porous—such as found in sandy deposits—are rarely given over to hardpan formations. On the other hand those compact soils containing a high percentage of the cohesive elements are often seriously affected. Between these two extremes of soil composition the hardpan is formed also in varying degrees.

It is interesting to note, in taking up the study of the hard formation in the ground, that hardpan is not found in the winter months, but it seems to appear just after the dry season or summer has commenced. Since this is true, the problem of properly tilling the ground takes on a serious aspect. In winter the trees can easily push their roots out in all directions, but in summer if the hardpan is present, not only will the trees have difficulty in pushing their roots through the ground to obtain proper nourishment, but the amount of moisture retained by the ground will not be sufficient for the trees to draw upon for any length of time. It is because the hardpan forms below the point of cultivation and extends to the depth of twelve inches and is practically impervious to water that the trees will have only a limited supply of moisture to draw upon. The roots which are in and below this hardpan will draw no moisture, for water will not percolate through the hardpan. It is literally true that one may irrigate to his heart's content in some places yet only a certain amount of moisture will be retained by the ground. Thus the reason that trees wilt soon after a good irrigation is because there is hardpan present.

Many observations have been made upon the subject of hardpan which will bear repeating here. The fact that hardpan is not found in winter or during our wet season, the fact that it is present in summer time and below the point of cultivation can be explained by a chemical reaction which takes place between a common constitutent of the atmosphere and the common cementing material or lime which is found in the soil. Why is it that in winter even our storm water ditches do not become hardened, yet in summer they seem to have a cement bottom as though man had actually placed cement in them?

As has been said already, the soil is made up of the same constitutents as the rocks. Thus there is a great amount of the common cementing material or ordinary limestone in the soil. Now if the carbonic acid will dissolve this cementing material out of the rocks, it will also break up the hardpan in the soil. The very fact that hardpan is not found in the winter time is easily explained by the fact that during the wet season the rain water being heavily charged with carbonic acid softens the hardpan by changing the cementing material over to the soluble bicarbonate of lime. But when the insoluble limestone is in the ground to as high a degree as three per cent of the soluble material, this amount is sufficient to form a substance which will hold the particles of soil together and render the ground almost impervious to moisture.

Possibly an objection might be raised at this point. Why, it may be asked, does the hardpan form at a point below the ground worked by a cultivator? Why does not the hardpan form on the surface as well? Some experiments were carried on in the laboratory to throw some light upon these questions. It was thought that if the above theory of hardpan were correct, the soil found in the hardpan would naturally contain a higher percentage of cementing material. If such were the case then it would be conclusive proof that hardpan is due to this higher percentage. After numerous experiments upon the surface and hardpan soils of Claremont, it was found that both soils contained exactly the same amount of lime. Other factors, therefore, must account for the formation of hardpan below the point of cultivation. In summer when the hardpan is present, the surface soil is frequently disturbed and cultivated, thus breaking up the cementing material on the surface so that no hardpan is formed there. It is true that if any ground is allowed to stand any length of time the hardpan will be found on the surface as well as beneath. Therefore, surface cultivation prevents the hardpan from forming above the point of disturbance.

But what is the reason hardpan reappears after it has once been dissolved? It is a well known fact, that the soluble bicarbonate of calcium will change back to the insoluble carbonate if ordinary evaporation takes place. It is well known, too, that especially in this section of the state, the loss of moisture by evaporation is enormous in the summer time. Heat is also a great factor in changing the soluble substance back to the insoluble or the cementing substance. In fact, less than one hundred degrees temperature is sufficient to do this. - - - - - - - - -

Some observation has been made which will go far to substantiate the theory of lime formation of hardpan. It has been noticed by many that the hardpan seems to predominate in summer time nearest the irrigation furrow. To explain this the irrigating water used must be considered. The fact is that the same substances of which the rocks and soil are composed, are found in small quantities, comparatively speaking, in the irrigating waters. For instance as compared with the other normal waters the irrigating water used in Claremont is highly impregnated with lime, about one hundred and forty-five parts per million being a conservative estimate. This would naturally be expected to follow, since as has already been mentioned, this water runs directly over rocks abounding in lime which form the beds of San Antonio and Ice House Canyons. Now, the lime is in the water as the bicarbonate, but when irrigation is going on, this highly impregnated water deposits the lime through evaporation and other chemical changes, (as the insoluble compound). Thus, the reason why the hardpan predominates near the furrows, is, that there is more lime near these places.

Now, having examined the constitution and phenomena of hardpan we may consider means for its prevention. Subsoiling is advocated by some. That is, to literally rip up the hardpan with a sharp instrument known as the subsoiler, is thought the best means of preventing and removing the hardpan. However effective this method may be, it is too expensive and too laborious. After the hardpan is torn up, the large chunks of dirt must be pulverized by some means before the soil can be worked. Some have even advocated the method of ridding an orchard from hardpan by the use of dynamite caps. A moment's thought, however, upon this method will convince one that it is not practicable. Not only is this method expensive and laborious but results in the tearing of great holes in the ground, which, especially in an orange orchard, is not to be considered. It has been shown in the discussion above that evaporation is one of the indispensable factors in changing the lime from the soluble to the insoluble form. Now then, if this element, evaporation, can be removed, the formation of the insoluble cement will be prevented—that is to say the hardpan will not form in the soil. Of course it is a factor which cannot be absolutely removed, but there are methods by which it may be greatly retarded. It has been noticed that it is almost a custom among the growers here to do their plowing in mid-winter. Now if the plowing is done late in the spring after the rainy season and before the hardpan begins, it will stir up the soil to a greater depth than cultivation would accomplish, thus causing the moisture to escape from the undisturbed ground less rapidly, and hence retarding the formation of the hardpan. This is one method. Another method which is not very expensive and which prevents evaporation to a great degree is to cover the ground with barn yard manure or even loose straw. If this is done in the late spring or early summer and plowed under, the ground becomes very mellow and evaporation is prevented in a very marked degree. One orchardist near Claremont follows this method and since it has been tried the orchard is almost free from any form of hardpan. Thus if these methods which are not radical in their nature, are only carried out, the presence of hardpan will be done way with to a great degree.

---

Those who have seen the beauty of the Salton Sea which has been made by the overflow of the Colorado River into the Salton Basin, were concerned to see a few days ago a statement that the Salton Sea will soon be no more. This was qualified in the same article though by saying that it will probably not disappear prior to 1925. If this is true we will be able yet to catch many fish from its waters before they entirely dry away. We believe it was the editor of the Imperial Standard who said that it was impossible to dip into the waters of the Salton Sea with a cup to secure a drink without first driving away the fish with a club so as to secure an opening.

## DEEP CULTIVATION.

As the attention which has been given to the matter of better physicial condition of the soil is creating particular interest in that line of work, it may be timely to refer to the latest invention of soil working tools which enables the deepest cultivation with the least draft of any implements we have seen. In the first page article in the issue of July 15th on "The Handling of Intractable Soils" in the form of a symposium, written by Prof. Wickson, Dr. Loughridge, Mrs. Sherman, Mr. Collins, Mr. Neff and Mr. Jones, some particular attention was given to the effect of lime and gypsum and the addition of humus. It will also be recalled that the advantage of thorough and deep cultivation was spoken of. About the time that article appeared, a telephone message from Lordsburg informed us of the try out of a new implement which was claimed to go into the soil and give it such a stirring as no other implement besides the plow could give to any soil. The telephone message sounded interesting and a Cultivator representative was present at the try out on the ranch of Valentine Peyton at Lordsburg last Thursday.

We say the "try out" although it has been used on this ranch for several months and on two or three adjoining ranches, but this was the first public demonstration, and fruit growers from various parts of California were present and criticised and commended the new implement.

The new cultivator is to be called the La Verne Rotary Cultivator, and is the invention of a blacksmith-farmer. That is, Mr. O. S. Jewett, a practical mechanic, coming to California and taking up the culture of oranges and lemons and finding himself confronted with a rather compact soil, soon saw that he would be unable to give the ordinary summer cultivation without the formation of the "plow sole" or hardpan which often occurs in such soil in a dry season. Mr. Jewett determined to use his knowledge of mechanics to construct an implement that would prevent that formation. He reasoned that if the soil mulch could be made so deep that moisture would ever be present in all the section below where the teeth of the working tool reached, there would never be any hardpan. He also found from experience that the ordinary cultivation would not give that depth. Plowing was, of course, out of the question during the summer months, as it would turn up the moister lower soil and turn under the dry mulch which should be kept on top. The disk came the nearest to filling Mr. Jewett's requirements, but it left the soil very uneven and turned it over more than he thought was wise. His observations and experiments finally resulted in the construction of a disk tool which is not a disk, that is, it has the rotary motion of the disk, but teeth of spring steel which, as The wheel is made up of six points or action down into even hard soil. The wheel is made up of six points or one-fourth or three-eighths inch by two and one-half inch steel sharpened at the ends so as to make good cutters. From center of wheel to point of teeth is eight or nine inches, and when the weight of the rider is added to that of the tool, these teeth are buried in the ground so that the dry dirt passes over the shaft on which the teeth revolve. This will make a cut of fully eight inches into a very firm and compact soil.

The cultivator intended for two horses has eight disks set at the outer ends of the implement, leaving a space in the center equal to one of the sets of four. In cultivating, the set at the right passes near and even under the branches of orange trees without injuring either branch or fruit, while the left end or outer side takes the center of the space. On the return trip the right side works against the opposite row of trees while the left set cultivates the space remaining from the first trip. The depth to which the teeth enter the ground is regulated by a lever which controls the angle of cutting. If set nearly straight the machine runs shallow and does not stir the soil as it would if set at a slight angle.

The horses handling the tool on the try out, though a good draft team, plainly showed that it was easily handled. Of course it goes without saying that very thorough and deep cultivation can not be given by a light road team, but we do not believe that any such depth of cultivation can be given with such light draft as this.

This cultivator has been used on Mr. Peyton's ranch for several months, also by Mr. L. C. Meredith, one of the pioneer ranchers of the section, who said that he had never found anything that worked his soil so satisfactorily as did this implement in the two weeks' test which he had given it. He is now anxious to have one as soon as possible, as were also others who were inspecting it on this first exhibition day. Unfortunately none of them are as yet manufactured. Mr. Jewett and Mr. Peyton hope to have in the near future a factory for turning out these cultivators, when they will be put upon the market.

A Hawaiian Pineapple Field.

Valencias are yet commanding fair returns, but all other oranges are barely securing freight and charges.

## THE AIR IN THE SOIL.

### Air For The Roots.

We may forget that roots breathe the same as do other parts of the plant. They obtain oxygen from the air and throw off carbon dioxide gas. The amount of air that is available for the use of the roots depends principally upon the condition of the soil. The spaces that occur between the soil particles are filled with air from which the roots obtain their oxygen. These spaces vary with the kind of soil and the treatment it has received. In clay soils these spaces are very small; hence, under equal conditions the roots in clay soils are not likely to be as well supplied with air as are those in sandy soils, where the spaces are much larger.

### Aeration by Plowing or Draining.

A most important result obtained from plowing or draining is the admission of air into the soil. Soil that is water-logged has its air spaces filled with water. Nearly all of our farm crops, excepting rice, would die in such a soil for lack of oxygen for the roots. As the water is removed by drainage, air comes in to occupy the spaces that were filled with water, and the soil is improved. Water, passing through the soil after a rain or after irrigation tends to ventilate the soil by putting the air in motion. This accounts for some of the advantages obtained from rain and irrigation.

Clay soils should not be plowed while wet, as this presses out the air and leaves the soil in a poorly aerated condition. Cultivation when the soil is in the right condition breaks the cakes or clods and allows the air to enter freely. Plowing at the same depth year after year produces a hard pan known as a plowsole. This interferes with the free passage of roots, moisture and air to the subsoil. Varying the plowing depth each year will prevent this condition.

After rains or irrigation, soils are apt to have a crust formed. This prevents the free passage of air into the soil. We should, therefore, use a cultivator to break this crust.

### Excessive Aeration.

In sandy soils, the spaces between the soil particles being large, air enters freely under ordinary conditions and constant stirring of the soil may allow an excessive amount of air to pass in.

The soil is inhabited by micro-organisms whose work is to break down humus and other organic compounds. The nitrogen of these substances is finally changed into a nitrate, in which form it is available for the use of the plant. If there is a lack of aeration these organisms cannot do their work. Other organisms that grow only in an atmosphere lacking in oxygen, develop, causing harmful effects. But in the presence of an excess of air and plenty of moisture the former organisms may multiply and act so rapidly that large quantities of humus may be transformed into soluble forms which may be washed away. This rapid transformation of humus is known as "burning out" of the soil. Since these soluble forms of nitrogen are likely to be leached from the soil, it is better that they should become available slowly. A rapid transformation of the humus is undesirable from another standpoint. In addition to its importance as a chemical or food constituent, humus is very necessary to the best physical condition of the soil. It not only enables the soil to hold moisture, but it also acts as an absorbent for certain fertilizing elements, thus keeping them from leaching away.

In order to conserve the humus in soils that are being "burned out," the soil must be treated so as to reduce the amount of air which enters. If this is due to constant cultivation, such as is sometimes practiced in orange groves, the practice must be changed, or humus should be supplied to the soil to make up the deficit.—Florida Ag. Exp. Sta. Bulletin.

## GATHERING THE OLIVE.

Whether olives are to be used for pickling or oil-making, it is very important that they should be picked carefully and at the right time. For green pickles they should be picked very soon after they attain full size, and before they have begun to color or soften.

For ripe pickles they should be gathered at the same stage of ripeness as for oil-making; that is, when they contain the maximum amount of oil. This will be shortly after they are become well colored, and before they have attained the deep black which signifies over-ripeness. If the olives are gathered before the proper degree of ripeness is attained, the oil will be bitter; if they are too ripe, it will be rancid. On account of the varying coloration in different varieties of olives, it is somewhat difficult to tell from their appearance when they should be gathered. When they can be easily shaken from the tree they are sufficiently ripe. If they commence to fall without vigorous shaking they are over-ripe.

For whatever purpose the olives are to be used they should be carefully gathered by hand. Rakes or sticks should never be used, as they bruise the fruit and break off numerous fruit-shoots needed for bearing in the following year. It is well to sort the olives as they are being picked, and to set aside bruised, diseased, or under-ripe fruit.—Joseph Hillman.

## JAPANESE PERSIMMONS.

Since its introduction into this country a little more than a quarter of a century ago, the Japanese persimmon or Kaki, has been slowly but steadily growing in favor. Where it can be placed on the market when nearly ripe, there has been and is always a good demand for the fruit, sufficient to make it profitable to cultivate it in a limited way. In the northern markets, however, it has not met with the favor that it was expected to receive. The reason for this, perhaps, lies in the fact that it comes into the markets with apples, pears and late peaches. Besides this, it must be shipped before fully matured, and being placed on the fruit stands while still unripe, the purchaser's first impression of it has too frequently been everything but favorable. Delicious though the fruit is when fully matured, there is nothing more repellent than a green, or half ripe, light-fleshed Kaki.

## THE FARM WORKSHOP

I have a small farm workship and operate the following machinery with a 3 H. P. gasoline engine: A farm feed mill, a bone cutter, emery wheels for gumming cross cut and small circular saws, a buzz saw for sawing limbs for fuel and a grindstone. Any man who has a good gasoline engine and a buzz saw (and a wood lot) need not fear the coal and oil trust. In my shop is a portable forge, anvil, bench vise and drill, taps and dies, and a soldering outfit. I have passed many a stormy day profitably in my shop, and believe that anyone having a farm and wood lot will find a gasoline engine and a shop with machinery similar to mine a very satisfactory investment.—Successful Farming.

---

A common mistake is to apply a remedy for insect pests that is intended for plant diseases and vice versa. Know what you are doing and go ahead. Remember that the fungicide is a substance used in destroying fungi or plant diseases, and insecticides are substances that are used in destroying insects.

# Deciduous Fruit Culture

By J. W. Mills

## HORNETS AND YELLOW JACKETS AGAIN.

IN a recent issue is a question from J. S. of Morgan Hill complaining of the depredations of yellow jackets, which is answered by Mrs. M. E. Sherman. According to my knowledge of the "bugs" she does not seem to know the difference between a hornet and a yellow jacket. To prove that they are very different from each other I will describe their nests. The hornet, to which I suppose she refers when she speaks of farmers offering money to the boys to destroy the nests, is the original paper maker of the world. It makes a big nest, sometimes as large as a peck measure in a tree or bush, and here I will say that I never knew them to touch or destroy any fruit, but so far as I can learn they destroy many other insects. On the other hand the yellow jacket is a great destroyer of fruit, especially the grape. I think if Mrs. M. E. S. were to undertake to destroy their nests she would have a tedious job, for the yellow jacket builds no large nest like the hornet, but is a mud-dauber and just makes a little ball of mud about the size of a pea and deposits an egg in each one and sticks the pellets a few here and a few there where they will be safe under the edge of a board and in dark corners. These hatch every few days during the summer.

The remedy I here describe I have tested in California. Eight years ago I lived up in the mountains near Santa Barbara where there were thousands of acres of wild land all about me. I had lots of grapes and the rocks were full of wild bees. The yellow jackets spoiled my grapes so that I had not many left, but I kept up with them. I picked up a half dozen old cans, cut the side out of each so that I had a flat pan. In town I had found some snow apples that had begun to rot. I knew that they would make good bait.

I put the teakettle and as many other vessels as I could get on the stove. Then I took an old sack and cut into about four pieces, put the cans over the place eight or ten rods apart, and put a piece of sack near each one so I could get hold of it quickly, also a piece of twine. In each pan I placed a few pieces of the rotten apples, then went to the house and got my teakettle of boiling water. By the time I got to the first pan there were fifty or sixty yellow jackets eating the apple. I very quietly laid the cloth on the pan, looped the string around it and poured on the cloth about a pint of the boiling water. Then I went on to the next pan until I made the rounds. Then I took off the cloths and found every jacket dead. The next day there were but few to be seen, but in a few days I repeated the performance. Although there were such swarms of them, I killed them off so clean that when next spring opened up there were but five or six to be seen. I then put out a pan with a piece of nice fresh lean mutton. Their sense of smell seems to be very acute. In this way I caught about twelve jackets and that was the last of them while I lived there.—C. F. Bockenoogen, Santa Barbara.

We trust Mr. Bockenoogen's hint may be of value. But as to his criticism of Mrs. Sherman's statement, we referred the matter to S. A. Pease of the Horticultural Commission of San Bernardino county, and he writes:

Your correspondent from Santa Barbara in taking issue with Mrs. Sherman has evidently confused insects from two different families of the family Vespina, the true wasps. The hornets and yellow jackets belong to the family Vespidae, the social wasps, and they always build their nests of paper. The insect he describes is probably one of the solitary wasps, family Eumenidae. These are often called mason wasps or mud-daubers. They closely resemble the yellow jackets in shape and color, but are comparatively harmless to man. John B. Smith goes so far as to say that they are beneficial and should be encouraged by the farmer. The hornets and yellow jackets on the other hand, besides the injury that they inflict with their sting, frequently attack fruit that shows the slightest sign of decay.

The yellow jackets as well as the hornets are dormant through the winter but the solitary wasp is putting her eggs safely away in mud balls.

I append a few quotations from the best authorities on insects.

Comstock says, speaking of hornets and yellow jackets: "The species of this genus enclose the combs of their nests with a spherical paper envelope. Any person who has no respect for the rights of yellow jackets has before him a lesson if he takes pains to disturb one of the oval gray paper nests."

Under genus Vespa, Prof. J. B. Smith says, "These are the hornets and yellow jackets. They are a nuisance sometimes in the orchard where they are apt to attack all fruits that show the least injury or decay, and they have been accused of puncturing juicy specimens, etc."

Prof. Kellogg says, "Yellow jackets and hornets are the ones which build the large subspherical nests familiar to all outdoor observers and related to much boyish adventure."

Folsom gives the same description of their nests and says, "The larvae are fed at first by regurgitation, upon the sugary nectar of flowers and the juices of fruits."

As to remedies I have had no experience but Mrs. Sherman's remedy is probably as good as could be suggested.—S. A. Pease, San Bernardino.

## GETTING A LIVING PRICE FOR FRUIT.

A subscriber living in Barstow, but having interests in the San Joaquin Valley writes to Mrs. Sherman telling of the difficulty he faces in the matter of securing returns for produce. We give the letter almost in full, with Mrs. Sherman's reply, hoping both will prove of value to others.

I would like to ask a few questions. I am, at present, employed as a conductor on the Santa Fe, between Barstow and Needles, the worst part of the California Desert, I own a little land at Ceres, Stanislaus County, in the Turlock Irrigation district. My father and a younger brother own 50 acres at the same place. The ranch has some alfalfa, but mostly peaches, and Thompson Seedless grapes on it. They are rather discouraged with the net results of both peaches and grapes. Prices for the dried fruit have been so low, although the trees and vines have borne well. It is about the shipping and packing of the grapes I wanted to ask you.

Father shipped a considerable quantity of the Thompson Seedless grapes to the San Francisco market last year green, and said there was more money in them that way. But the commission men complained of the condition in which they reached the market, and the returns made were not what he thought they ought to be. I am going to try and get off and go to Ceres next month, and to San Francisco, and help to see that the fruit is packed right, and see in what condition it reaches the market and see if the commission men are making just returns.

From your paper I take it your grapes are largely the Emperor, and your market, New York and the East. Have you packed and shipped much of the Thompson Seedless for the San Francisco market? What is the best way to pack and ship, boxes or baskets, and what size? Can you tell me in a few words the best method of handling and packing them? Should our grapes stand over any time between picking and packing. You spoke of stacking your sweat boxes, and "after 24 hours the stems are limber enough to pack." When does your picking and packing begin?—R. T., Barstow.

Prices have been low on dried fruit, yet I have faith, and on that am about to cut peaches for drying. We have been packing all week for the Eastern market. The almost impossibility of having the peaches handled as they should be for shipping has grown discouraging, and today I am keeping out of the packing house. I can control the pickers and hauling but am greatly tried over the way the fruit is put through the packing house. The women and girls if left to do their way handle the fruit gently, but the men are terrors. They slam the crates around as though they were filled with cobbles stones.

We never ship to the San Francisco market on consignments. That with us is an f. o. b. market here at Fresno. The San Franciso markets

(Continued from Page 119.)

POTASH

You can no more get wheat without straw than you can get cream without milk. If you get too much milk for too little cream, don't starve the cow to reduce the milk, but feed her for *richer* milk. If your wheat this year shows too much straw and not enough grain, feed your soil this Fall for wheat that will grow *more* grain next year.

Complete your commercial fertilizer with **Potash.** It builds up a strong, sturdy, well rooted, springy wheat stalk, fills out the grain, and carries it through wind and rain to make a profitable harvest for you.

POTASH PAYS

Add enough **Potash** to your fertilizer to bring it up to a 2-8-6 formula. Two pounds of Muriate of **Potash** to each 100 pounds of fertilizer increases the **Potash** total one per cent.

# Live Stock and Dairy

By Mrs. Minna E. Sherman

**Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.**

### VALUES

GOOD horses in the barn that will sell for profit, good pigs in the pens that are growing hourly into hogs, good cows in the milking string that are making good returns every month from the creamery,—these are the strings that a farmer may use as side issues, while the peaches turn red and the grapes grow sweet and the orange trees tail not to blossom and set their golden apples. These crops of animals are not suddenly cut off by frost nor are they liable to sunburn. The stock crop is reasonably sure but it must be handled the same as any other crop and turned off when ready for the market. The horses and cows must be sold when at their best and young stock coming on fill their places. The stock farmer is the source of supply for the orchardist that depends on buying his animals. Now with this stock industry the main dependence, the orchard and vineyard become profitable from the case where the milk was rich, the per cent of fat has to be too high; while in the last the amount of milk is too great. The cows lack balance and are more easily thown off their feed than the herd that is nearer to the natural amount of fat or milk flow. A litle cold or a little irregularity in the feed and the poorly balanced animals are made ill.

#### Balanced Cows.

The balanced cow, fed on the balanced ration, and milked regularly by a well balanced milker, may be counted to keep the balance on the right side of the ledger. The common cow pays well after she is culled out from the lazy members of the herd. I often wonder if the losses of starting and culling out a herd would not be as much as the cost of buying a few aged cows of established test and from these pure bred ones raising a herd? If I intended to build a herd I should not buy heifers of common stock but older cows that had been left from year to year by the dairyman as profitable in his herd. The breeding of these cows to a pure bred sire will give quicker results than the use of any kind of heifers to start a herd with. The misfits have been culled out from the older cows in a measure. Even in the first generation of cows raised from these older cows there will be enough that have to go to the butcher.

An Imperial Dairy.

heavy fertilizing they receive and the returns may be considered as profit of the dairy and stable, or the other point of view may be taken and the vineyard and orchard considered the main source of profit and the live stock industry as the side issue.

#### Paying

Good cows in the milking string, if the milk is not weighed once a month for three days and tested, will often not receive all the food they are capable of using. Sell the cows their food and care, the same as the vineyard is sold its labor and fertilizer, and if it does not balance up at the end of the year it is counted out as a source of profit. The cow that does not pay well is much easier disposed of than the vineyard or orchard, as the butcher will take her and convert her into beef at once. Cows averaging 300 pounds of butter will give from 5000 to 6000 pounds of milk yearly according to their breed. Now I would not care to have a herd of cows making 300 pounds of butter from less than 5000 of milk for the reason that the milk left after the fat is removed is too valuable on the ranch for feeding. Again, I would not care to have a herd on the other extreme of producing at the rate of 10,000 pounds of milk to make the 300 pounds of butter. In the first

#### Good Cows.

There are good cows to be found in the herds that the dairymen sell off. There is now in the dairy papers the record of a cow picked up in a common bunch that makes 600 pounds of butter. While this is a lucky strike, I often think that if these cows that do so well have their pedigrees traced they might prove to be full bloods after all. I have thrown out full bloods from the herd that had poor conformation and that lacked vigor and sold them with grade cattle from time to time. Now these cows were culls, not from a milk or butter standpoint, but from the breeder's standpoint. These cows might fall into the hands of a man using a sire of pure blood of the same breed and the value would be in the offspring. I do not think for an instant that I am the only breeder of registered stock that throws out a heifer every now and then. So these cows making record of 600 pounds a year are probably the descendants of this class of stock. Now a certain cow won the first prize at

**The Cutter Laboratory**
Berkeley, California

Sacramento as a dairy cow for several years. The type in her had been bred too fine and while her daughters would be right to breed from, if their sire was a vigorous animal, her sons would not be fit to head a herd as they would lack stamina. The transmission through the male of the character of his dam is very strong and the head of the herd should have a dam that is as nearly perfect in vigor and as purely feminine as possible. Then if the boy looks like his mother and has the twinkle in his eye of mischief, and a touch of bad temper, he is apt to be desirable.

**Six Hundred Pounds.**

Now, if this cow making six hundred pounds is really a grade cow, the temptation to use her sons will be great, but it should be resisted, for while that was the the way the first butter herds were bred up, still it is a slow way when there are pure bred animals to be purchased cheaply. In California the chances are always of grade stock running to beef, because the early breeders were beef men and understood their business. The importation of dairy sires has only been a matter of business for ten or twelve years while the beef breeders have been bringing in their sires by the carloads ever since the railroads were built.

Not one or two, but a hundred at a time of these Shorthorn and Hereford sires have gone on the large ranches around the Great Valley. Now, if a grade sire is used the chances are that the cold beef blood, will come out in a large number of his calves. We have milking shorthorn strain that are good and anyone that walks around Berkeley quickly thinks that the private family cows are all red shorthorns, so many are seen tethered out.—M. E. Sherman.

## HOW TO MAKE SCHMIERKASE.

Cottage cheese, sometimes called Dutch cheese or schmierkase, is made from skimmilk, writes K. A. Ulmann of the Nebraska station. A small amount of buttermilk may be added. To make cheese, allow the skimmilk to become sour and curdled. Heat it then to from 90 to 100 degrees F. in about thirty minutes. After reaching the desired temperature remove the vessel from the source of heat and leave the curd in the hot whey for about fifteen minutes. Remove then the whey by pouring the heated clabber into a cheesecloth bag or on a draining rack (made out of wire screen with cheesecloth spread over it) and allow to drain until no more whey appears. The higher the temperature to which the clabber is heated, or at a like temperature, the longer the time of heating and the longer the curd remains in the hot whey, the harder and dryer the cheese will be. By regulating the time and temperature we can always produce cheese of the desired consistency.

The yield is about fifteen to twenty pounds from 100 pounds of skimmilk, and the price is about ten cents per pound. Before using or selling, the curd must be worked thoroughly and some salt and cream added. The amount of salt added depends upon the taste of the consumers, two ounces to each ten pounds of cheese is a medium amount. Adding cream greatly improves the flavor of cottage cheese, and since under ordinary conditions a pound of medium rich cream, testing, say, 25 to 30 per cent. fat, never would be worth more than ten cents, there is no danger of losing money by adding cream to cottage cheese. One pound of cream to ten pounds of cheese is a fair ratio. In a cool place cottage cheese may be kept for several days. The softer the cheese the sooner it will spoil and sour. Always use good, clean skimmilk; do not let it become too sour.—Pacific Dairy Review.

**Beats All**

This picture shows just one of the many ways in which Sharples Dairy Tubular Cream Separators beat all others. The little piece in the almost empty dish pan is all there is inside Sharples Dairy Tubular bowls. The many disks in the other pan are all from one common "bucket bowl" separator—just an example of the work of common separators as compared to cleaning the simple Dairy Tubular.

Tubulars are made in the world's greatest separator factory. Branch factories in Canada and Germany. Sales exceed most, if not all, others combined. Write for catalog No. 260.

## THROWING THE HORSE AND COW

For important operations the horse or cow is most easily confined by throwing. Many times, however, the farmer loses time and much of his good temper in performing this act simply because of no definite method. The following, known as the side-line method, is very satisfactory for throwing horses. Using a three-quarter-inch rope about forty feet long, double it at the center and at this point tie a loop about two feet long. This forms a sort of collar which is slipped over the horse's head. The free ends of the rope are then brought down between the front legs and each passed under the fetlock joint of a hind leg (preferably from within out), passed once around itself and the end then run forward through the collar. Assistants now pull backward on the ropes while the horse is backed. This draws his legs well forward and up on his sides. As soon as the horse is down the feet can be tied in this position with the rope.

For throwing cattle the half-hitch method is hard to beat. The rope may vary in size, but need not be larger than one-fourth inch and probably thirty feet long. The animal is confined by the head, one end of the rope tied to the horns or about the neck, a half-hitch taken about the animal's body just back of the fore legs, and another just in front of the hind legs. Then by simply pulling on the rope and tightening the half hitches, the animal will go down. Try it once and see how easy the cow falls.—Missouri Agricultural College.

### HOW CATTLE TICKS SPREAD TEXAS FEVER.

The microscopic parasite which causes the disease known as Texas fever or tick fever of cattle is found in the blood of affected animals and is transferred from one to another by means of the fever tick. A remarkable feature of this transaction is that the disease-producing parasites are transmitted through the egg of the tick that draws the blood, and not directly by the old tick, as an engorged tick after dropping from the host (cow) dies without ever attaching itself to another animal. But its offspring, produced by the eggs laid after it drops off and before it dies, carry the infection and inoculate the first cow they get on.

The length of time elapsing between the exposure of susceptible cattle to infection by ticks and the appearance of Texas fever among them is dependent upon the climate and the development of the ticks. Thus, if northern cattle are placed on pastures, highways, or in pens, cars, etc., in summer immediately after the premises have been infested with ticks from southern cattle, Texas fever may occur in from thirty to sixty days, as the female ticks which drop from southern cattle must lay eggs and these must hatch before the northern animal becomes infested with ticks and thereby inoculated with the disease. After the seed ticks become attached to the animal the disease will appear in about ten days in summer or a somewhat longer period in winter. In fact, the disease may occur before the ticks are large enough to be seen without a very careful search.

One objection that has been advanced against the fact that the cattle tick is a carrier of Texas fever is that cattle are sometimes found to be suffering with the disease without showing the presence of ticks on their bodies. This condition in the case of southern cattle may be explained by the fact that the animal already had its blood infected with the parasites and under normal conditions was resistant to Texas fever; however, as a result of lowered vitality caused by some other disease, or by exposure, privation, injury, rough handling, etc., this resistance has been reduced and finally overcome, and the parasites at last succeeded in producing the disease. On the other hand, when this disease is observed in northern animals, the young seed ticks may be so small and so few in number as to be unobserved.

Under certain conditions, as when living on horses, mules, etc., the ticks lose their infectiousness, and when southern cattle not previously infested with any but these noninfectious ticks come in contact with infectious ticks they are just as susceptible as cattle raised on tick-free pastures.

Many cattle appear perfectly healthy and yet are infested with ticks and have the fever parasite in their blood. Sometimes the owners can not understand why such animals should be regarded as dangerous to others, and consider it unjust that they should be subjected to quarantine restrictions. The fact is that such cattle have usually contracted the disease in a very mild form at an early age and have become immune to further attacks, although still carrying the parasites in their blood. They are dangerous because the fever parasites in their blood may be transmitted at any time to susceptible cattle by ticks.

While the disease may be produced artificially by inoculating a susceptible animal with the blood of an infected one, it is spread naturally only by the ticks. By exterminating the ticks, therefore, the disease can be stamped out, and the quarantine can then be removed.

The discovery of the part played by the tick in the spread of Texas fever was made by the Bureau of Animal Industry of the United States Department of Agriculture in 1891, and the same principle has since been found to apply to the transmission of malaria and yellow fever from man to man by mosquitoes, and to the spread of certain other diseases.

In Kern County's Rich Pastures.

### ALFALFA FOR SWINE.

No community with high-class swine prominent in its husbandry is poor. No community with large areas of alfalfa can afford to neglect swine husbandry, for its people possess the material for economical pork production equaled by no others. Those who know it best are persuaded that alfalfa will grow, with varying degrees of thrift to be sure, in every one of the United States and in Canada. Hence it is not a mis-statement to say, speaking generally, that the American farmer without alfalfa is so through his own fault rather than through any fault of location, latitude, longitude, altitude, precipitation or temperature. These premises being correct, it would seem almost self-evident that he who would rear swine to the best advantage should have alfalfa, and, conversely, the man with alfalfa fields is provided with a part of an excellent equipment for profitable swine-growing. Either interest which is a stranger to the other should take early opportunity for a mutual acquaintance.

As a pasture or soiling crop for sows and young pigs, alfalfa proves a wonderfully helpful ration for milk-making in the sow and for growth in the pigs. Experiments have shown that pigs make better growth when the dam is fed considerable alfalfa than those from sows fed the best of commercial rations, but with no alfalfa. Of two sets of pigs, one fed clover, rape and soaked corn, and the other with access to alfalfa in lieu of clover and rape, those having alfalfa seemed to grow the more rapidly. For brood sows it is a most valuable food, either as hay, a soiling crop, or as pasture. The litters of such sows are generally large and vigorous and the dams have a strong flow of nutritious milk. Alfalfa meal in slop may be used with profit where the hay is not to be obtained. It is also claimed that sows fed on alfalfa during pregnancy will not devour their young, its mineral elements seeming to satisfy the appetite of the sow, while contributing to the fetal development of the pigs.

On a farm of former Governor Hoard, in Jefferson county, Wisconsin, all the brood sows have for several years been wintered on alfalfa hay of the season's third cutting, and their drink (skim milk from the dairy), without any grain until the last two weeks of gestation. Mr. Hoard says the object is to give the sows a food that will keep them in a non-feverish state and furnish protein sufficient to build the bodies of the forthcoming pigs.

A Finney county, Kansas, farmer reports having pastured 30 pigs on one acre of alfalfa from May 1st to September 1st, when they weighed 100 pounds each and were in fine condition for fattening. Another Kansas farmer reports keeping 100 pigs from about the middle of April to September on five acres of alfalfa pasture. A little grain during the last two months would have gained him many pounds of pork. Many alfalfa raising pig-growers insist that their pigs can be maintained from May to October on alfalfa for one-half what it would cost for almost any other feed.

The Utah station found that young shotes gained one-third pound a day on alfalfa pasture without grain. But the station found also that the gain was not so great in older hogs. A Wisconsin dairyman reported that he kept nine sows all winter and spring on alfalfa hay and skim milk, without any grain, and raised from them 75 pigs, all healthy and vigorous.

The Colorado station considers that a ration of three-fourths corn and one-fourth alfalfa hay is the best for fattening hogs for market, but for young hogs not ready for fattening the proportions should be reversed. The station does not recommend grinding alfalfa hay for hogs, probably on the theory that the hog's time is not worth much at best, and he can do his own grinding.—From Coburn's "Swine in America."

### MAKING A BRAN MASH.

Everybody is supposed to know how to make bran mash, but it is only in racing stables and large studs as a rule that it is properly done. To make a bran mash, first wash out a bucket with boiling water, then pour in the quantity of water required, say three pints, and stir in three pounds of bran. Cover and leave it for two or three hours or more, if not required for immediate use. A mash requires hours to cool off and is often given to a sick horse too hot and is refused when it would have been taken if properly prepared and fed when warm instead of scalding hot. The addition of a tablespoonful of salt to the ordinary mash can be recommended to keep down parasites and promote digestion, but should not be a part of the sick horse's diet unless specially ordered.—North West Poultry Keeper.

### PIG-EATING SOWS.

Sows may be kept from eating their pigs by giving them a great variety of food for two months or more before the pigs come along. It should include some animal food and plenty of salt.

The great mistake made by too many who attempt to pasture swine on alfalfa is in overstocking. There is a tendency or temptation to keep in a pasture more stock than it can comfortably support, with the result that the alfalfa plants are gnawed, trampled and rooted out, while the animals fail to prosper as they would under more rational treatment.—From Coburn's "Swine in America."

## CABBAGE GROWING.

CABBAGE, like the onion and celery crops, is best adapted to a cool, moist, loamy soil. The cabbage is also a gross feeder, so heavy manuring of the soil is essential. This plant adapts itself to a great range of climates. However, we believe the very best product is produced in the mountain valleys, where the nights are always cool and the days not very warm.

The preparation of land for cabbage growing does not materially differ from that of other garden crops. It should, of course, be put in good tilth, and an abundant supply of well-rotted stable manure is desirable.

Cabbage seed must be sown six or seven weeks before it is desired to set the plants in the field. If sown in hotbeds, the seedlings are not usually transplanted until they are set in the field. The growing of plants in the greenhouse, or in hotbeds, is a trade in itself, the details of which must be carefully looked after. Seed for late varieties is usually sown in the open ground. Several sowings should be made.

Of recent years young cabbage plants have suffered greatly from the attacks of the flea beetle. In many instances growers have lost their entire plantings by the ravages of this pest. The only practical way to combat this insect on the young cabbage is to grow the plants in frames where they may be covered with thin muslin. The most critical time is when the plantlets are pricking through the ground. The shading afforded by the muslin at this time does no harm.

A bed 12 feet long by 6 feet wide will grow enough plants to set one-half acre of land. It is usually estimated that one pound of seed will produce plants enough for four or five acres of land.

After the land has been put in a good state of tilth, ditches are made in the direction that will make irrigation most easy. The distance between the ditches will vary from 24 to 36 inches, according to the variety grown. Rows 28 inches apart are perhaps most common. After the ditches are made, one man drops the plants 15 to 18 inches apart, and another follows to do the planting. The plants are set on the side of the ditch, and as soon as possible, water is turned in to follow the planter.

Water is run through the rows from four to eight days after the plants have been set, and sometimes this irrigation is repeated two or three times before the ditches are filled. When the plants have become well established, the ground is leveled either by hand or with a cultivator. While the cabbage is an easy crop to grow, yet it is quickly injured by improper irrigation. It will not stand a water-logged soil.

There are a few insect pests and diseases, and of this number the flea beetle is the most injurious. It can be controlled as mentioned above. Cabbage lice and cabbage worms are not usually abundant enough, under field conditions, to seriously affect the crop. The black rot of cabbage occurs some seasons. Its presence is known by a portion or all the cabbage head becoming soft, dark colored, and foul smelling. There is no remedy for this trouble, except possibly in the rotation of crops. However, it does not appear every year upon the same land, as is common in the East.

The cost of growing cabbages is estimated at about $33 an acre, and the average price for the past ten years has been 45 cents a hundred pounds.—W. Paddock, Colorado Agricultural College.

Pineapple Packing Houses in Honolulu.

## RAISING CRESS FOR MARKET.

The woman owning a bit of ground, across which runs a stream of water, is fortunate indeed; especially if the home lie within daily driving distance of a city.

For this low, moist ground, considered usually as so much waste space, may be made to yield dollars to the woman capable of grasping the possibilities of cultivating water-cress.

This delectable salad plant is more valued in these days than ever before, and the supply is never equal to the demand.

As the first step, have the stream cleared, ready for planting the cress. This may be done by plants or seeds, either of which may be procured from any reliable dealer. Better buy the plants.

Set two rows the entire length of the ditch. Pick up six or ten stalks, lay them at the bottom of the ditch near the side so the tops will be above the water, then two feet from there set another bunch of plants on the other side, anchoring the plants by placing a pile of earth on the roots.

If the plants must be home-grown from seed, make a seed-bed near the spring in soft, wet ground, but do not let the water run over it. Scatter the seed and press into the mud with a spade Transplant the plants any time when large enough to handle.

When the cress has grown and spreads over the top of the ditch, have it mowed close to the top of the water, clearing away all clippings so they will not choke the stream. When it grows up again fresh and crisp, you will be ready to market your product.

Place a plank across the ditch on which to sit, gather the cress with the left hand, and cut with a sharp knife, having the stalks about three inches long.

Bunch neatly, fastening the stalks with a rubber band, and cutting off squarely. Sprinkle lightly and keep from the sun until sold.

Cress may be sold for shipment, for consumption in the home market, or to individual customers, the price per dozen or per bunch varying with different localities.

If the cress is crisp and tender the matter of marketing will take care of itself, and the returns will be sufficient and sure.

Cabbages require frequent and thorough cultivation, especially at the start. As soon as they have recovered from the effects of transplanting, it is well to cultivate them and work as close to the plants as possible. A boy should follow the cultivator to uncover those that have been covered. As soon after a rain as the ground will permit is the best time to cultivate, but one should go through them once a week at least until they pretty well cover the ground.

# The Ornamental Garden

## PLANTS ABOUT THE HOUSE.

THE title of this article may be misleading, in a sense. I shall not treat of plants all through the house, but rather of plants located close to the house, set in such a manner as to hide the foundations thereof, and in the case of vines, its walls.

To the writer, a house with exposed foundations always seems unfinished. It needs the grace of growing plants to take away the bare look which is never pleasant, no matter how expensive the foundation may be. There is a beauty in leaf and flower that cannot be put into stone and mortar.

Perhaps I may be allowed to use this expression—the use of plants close to the house, while not detracting in the least from the dignity and importance of it, prevents us from looking upon it as something that boldly challenges the attention—an idea not in keeping with the homesense which ought to characterize the building in which those live who care less for show and admiration than for beauty. All of us have seen houses which seem to absolutely force themselves upon our attention. We may admire them, in a way, but it is a way with which the idea of home is not associated.

They have too public a look to suggest hominess. But if shrubs, and perennials, and vines were planted about them, their aggressiveness would be hidden, or at least modified, and we would soon begin to think of them as homes instead of houses.

I don't know that the reader will get just the idea I have in mind, at first reading, but little thought along this line will soon make it clear to him.

No very tall-growing plants should be used anywhere about the house if they will interfere with the outlook. Windows are made to let in light and sunshine, and we cannot afford to darken them with bushes or vines. The windows are darkened, free outlook is interfered with, and the general effect is monotonous.

One vine, planted at the corner and trained along the cornice, over the windows, with a few branches allowed to droop here and there, would have given a much more satisfactory effect. A vine used in this way has a chance to display its individuality. You see all its charm of leaf, and habit of growth.

The best plants to use about the base of the house are those which do not grow much higher than the wall. Among hardy kinds there is nothing better than Dicentra, the dwarf varieties of perennial phlox and the herbaceous Spireas. Along with these can be used such annuals as the Nasturtium, Nicotiana, Aster, Ten Week Stock and Coreopsis. Here Geraniums and Coleus can be made to do duty in summer.

Bulbs for early blooming can be scattered along the outer edge, close to the path. To edge the planting, Pansies, Bellis perennis, and the low-growing varieties of Phlox can be used effectively. To furnish brilliance in midsummer, the Gladiolus can be planted in groups here and there, and the Tuberose to give bloom and fragrance later in the season.

Indeed, these about-the-walls collections can be made up of a "happy family" of plants that will give a vast amount of pleasure because of lack of formality in arrangement, and because of genuine merit possessed by them. Homey, old-fashioned plants will please best of all, because they will be in keeping with the character of the place they beautify.—Am. Farm World.

## THE BACK YARD VIEW.

A woman writer in a recent number of the Outlook discusses the "back yard view" and inquires it there "could be anything more uninteresting and forlorn than a row of back doors?" This has no doubt occured to many observing people and as the writer asserts it presents an "overwhelming picture of the failure of man to rest himself comfortably, simply and beautifully, and it is a tragedy of civilization that he has failed so signally in solving it."

In reply to this a Boston exchange says: Let us regard it rather, as a triumph of civilization that he is succeeding, if slowly yet against tremendous odds, in bringing the problem within measurable reach of solution. Unless we at times look back over the road upon which we are journeying we cannot form a fair estimate of the difficulties we have surmounted or the progress we have made. It is too true that there may still be found in our cities and town veritable deserts of monotonous weariness, and that beauty in our day continues to pause too often at the village outskirts; but it is equally true that the modest city, town and village are vastly more attractive than the city, town and village of a half century ago.

Moreover, men and women in great number, with great disregard for their own time, leisure and comfort, with great civic pride and with great love of the beautiful, are transforming the very scenes, to which the Outlook writer refers. As a result of a few years' faithful work on the part of municipal art leagues and backlot societies, there are great districts in all of the big cities of the country today, east as well as west, which are laid out and built up, and kept up, with regard to the elimination of back-yard ugliness.

Although an immense amount of work must be done among the mansions, apartments and tenement houses before anything bordering on ideal conditions can be reached, there is nothing in the situation or the prospect that is hopeless. On the contrary, seeing that people are becoming more and more discontented with the bare, the desolate, and the ugly, and more and more attracted by the things that are bright and beautiful, there is all cause for encouragement.—San Jose Times.

This question is not only a live one for mansion and tenement, but for the rural back yards as well. There are possibilities for wonderful talent in a back yard lawn and flower bed.

---

These thrive in the sun: Verbenas, nasturtiums, phlox, petunias, nigellas, geraniums, candytuft, cypress vines, thunbergias, hyacinth-beans, morning-glories, and in fact almost all of our bedding annuals.

---

Never slit the bark, bore holes or drive nails into trees.

## GARDEN NOTES.

Do not cut out large limbs.

Prune annually, but never heavily.

Wounds heal more rapidly in spring.

Heavy pruning conduces to wood growth.

Never use a hatchet for removing suckers.

Avoid injuring the cambium in any way.

Don't leave your pruning to the hired man.

The more you understand trees the better you will prune them.

A severe heading-back will renew the tops of old peach trees.

In transplanting be careful of the root-hairs.

In transplanting cut back top and root.

Drastic pruning strikes at the vitality of the tree.

Do not start all main limbs at the same height.

Summer pruning induces fruitfulness.

Torn wounds are generally fatal.

Paint over the large wounds.

Trees are delicate structures and require careful handling.

A heavy pruning is always followed by a heavy growth of suckers.

Never allow stock to prune your trees.

Unpruned, uncultivated orchards are not money-makers.

The orchards is not a profitable source of firewood.—Orffs Review.

## CHANGES OF THE CHAMELEON ROSE.

White in the shade, red in the sun, such is the two-fold character that has given a name to the chameleon rose. At night, or when it is carried into a dark room, it assumes a wax-like whiteness. This does not occur abruptly, but the petals first pass through a blush tint, which rapidly changes into a very pale rose, and finally ends by becoming the purest white. Then, if it is taken into bright sunlight, with the greatest rapidity it resumes the scarlet tint of the most brilliant peony. This horticultural phenomenon comes from Japan, that country of magic gardens and wizard horticulturists.—La Petit Jardin.

---

Water from the hose that has been lying in the sun for a few hours is hot enough to kill grass on the lawn or flowers in the beds.

A narcissus bed may be used for petunias without removing the bulbs. Bend the tops down; set the petunia plants between the rows. The soil should be worked up two inches deep and a liberal supply of commercial fertilizer or chicken manure worked into it. By the time the narcissus tops die the petunias will be large enough to occupy the space. Water applied to the bed during the summer will not injure the sleeping bulbs.

---

Confidence and intelligent work will come pretty near making a success of anything.

## HAVING CALIFORNIA'S EXPERIENCE.

The effort to bring the orange growers of Florida together in a co-operative marketing organization is resulting in much the same tactics from the opposition, apparently, as were used in the California fight at the beginning of the organization of the exchange. The orange growers of Florida have drawn upon our state for two excellent workers, one for permanent service in the business management, in the person of Mr. R. P. Burton, formerly sales manager with the California exchanges. Mr. J. A. Reid, secretary and manager of the Semi-Tropic Exchange is using his logical arguments to bring the Florida growers together. Mr. Reid has had experience here and we doubt not is giving some good co-operative gospel to the Florida growers. But we note in the Florida Fruit and Produce News, which has been chosen as the official organ of the Florida Citrus Exchange, a "Warning To Growers" in which they are urged not to "bind yourselves or contract to sell your crop at any price until after the big orange growers' convention is held in Tampa." Plainly the buyers and contractors are anxious to entangle the producers in agreements before the exchange can be placed upon its feet.

The exchange in Florida can encounter no more bitter fight in its organization than did the growers of California, and this should not discourage them for one moment, for if it does, the strenuous efforts which have been made are liable to fail, and the chaos and poor results of the past few years will be the lot of the growers of that state.

The fact that the energy of the few is bringing the Florida growers so near together may give an advantage to the grower who prefers to remain outside, but only for the time being, for if he lets his narrower selfishness dictate instead of encouraging that which will be his ultimate salvation, he may let the penny before his eyes blind them to the dollar farther beyond. The present effort on the part of the Florida growers will be a measure of the intelligence of the people of Florida. If it fails, it will show that they have not sufficient grasp of the situation before them to impel them to take the steps necessary for their final success.

## BEGINNING RIGHT.

We have just received a copy of "Conservation of Resources in California," a pamphlet of about one hundred pages taken from the twenty-third biennial report of Edward Hyatt, Superintendent of Public Instruction of California. It is a departure from anything we have ever seen in a report by a Superintendent of Instruction. It was inspired by the call of President Roosevelt for the conservation commission, and takes the stand that the question of conservation is of vital concern to the greatest and most brilliant minds of our day. In his foreword, Superintendent Hyatt says of the question of conservation: "It is vitally important, for without it our nation is doomed to go down to poverty and weakness. It is unselfish, for it looks forward to the welfare of those who come after us rather than for our own little personal benefit now. I have become possessed with the idea too that it is highly important for the school people of this state to join in this movement; for them to grasp its significance, appreciate its momentum, take hold of it strongly and intelligently. Such a movement as this must fail unless it can be projected into the future."

The book is full of suggestions which may be used by teachers in school work or by pupils in special debates, recitations and essays.

It cannot be said that this movement means any great change in the sentiment regarding conservation for today, or possibly for this year, but ultimately we believe that great good can be shown as the result of this step in the schools of California. We trust that every teacher in the state will enter into the spirit of the movement.

## FROZEN ORANGES.

In its issue of June 10th under the caption, "Dried Fruit," the Cultivator took occasion to refer to the injury of the citrus fruit market through the shipping of "pithy, punky, dry 'rag'," which is the name sometimes given to fruit resulting from the severe cold weather of the past season. We referred to the fact that many sections of California have produced some exceptionally fine fruit which has been exempt from injury by frost, and we added, "Every effort should be made to protect the market for this good fruit, and the most assured way to do this is to cull out all dried, punky oranges, even if they have been shipped under no-name labels, and so keep them from injuring the industry." It is plain that the injury to California fruit has been much more serious than most orange growers were willing to admit earlier in the season. Even yet Valencias are going forward which have been frozen so badly as to contain but little juice or to be at least, as one grower expresses it, "in a state of insipidity."

One of the large Valencia growers of the state who has visited as many groves as any, finds that some sections show a very great amount of the injured fruit and unfortunately much of this injured fruit is still going forward to the market. The discovery of this condition caused him to cast about to find a possible method of controlling the shipping of this undesirable product. He does not claim that he has yet reached definite, satisfactory conclusions, but he presents a suggestion as to a means of solution of the problem which may at least inspire discussion. His proposition handed to the Cultivator is as follows:

"It is pretty well agreed by all citrus growers and shippers that the placing on the market of frozen oranges hurts the sale of the sound fruit, and that California—or for that matter, Florida—has never yet experienced a 'hard freeze' when the citrus market for that year has been satisfactory even to the shippers of A-1 fruit. How to prevent the forwarding and placing on the market of the damaged fruit to the detriment of the good, has been a problem that has kept many of us guessing. I believe that the solution of this important matter lies with the United States Government. Let inspectors be appointed at all large markets and have the fruit inspected as are other food products. Frozen fruit is injurious to health.

"When a few cars have been condemned early and dumped, with the attendant financial loss, I believe Mr. Grower and Mr. Shipper will take no more chances at this end. An examination by a government inspector would be fair to all. With the enormous citrus crops that we shall have in a few years—in fact now have—we cannot afford to be independent and force poor fruit on the public.

"The Exchange could take this matter up in the proper channels at Washington and, I believe, could arrange it satisfactorily. The details of the plan would have to be thought out carefully. I am merely making a suggestion that I am sure could be worked out to the general good."

As soon as we had read the above, there came to our minds innumerable questions, as will probably be the case with every citrus grower. "Who will pay the expense of the inspection?" "How many inspectors will be required to meet the cars at all eastern points?" 'Will it not give the industry a black eye to have it proclaimed broadcast that our oranges are frozen?" These, with a thousand and one other questions will spring to the mind at once. But something must be done, and the suggestion submitted possibly may serve as a starting point for definite action along this line. As the subscriber says, it depresses the market and creates a distruct so that the good fruit which is shipped commands only indifferent prices. Perhaps it would be a better plan to have the inspectors located at this end of the line. A good system of inspection could be maintained by having inspectors from the department who would have no prejudicial interests in California. Of course, every fruit grower lives "in the choicest section of the state and his particular community has no frosted fruit," but a neutral inspector who knows the fruit only by car number and can examine it and determine whether or not it is injured, is qualified to pass it on to its destination or order it dumped.

At the beginning, such a system of handling our fruit would work great injury to some who happen to be in the frosted sections, but it would soon create care in growing and packing the fruit that would ultimately lead to justice and, we believe, profit to all.

It is well known that the frosty sections of California vary from year to year. A section that is injured badly this year is exempt the next year or for a period of years. There is nothing gained by saying that the frost does not visit our citrus sections. It does, or at least may in a period of years, and a frank discussion of methods of prevention and of holding back the fruit so that it will not injure the market, will prove of great value to the producers.

## INCOME OF CITY FROM FORESTS.

The Cultivator recently had a short article referring to a city in Germany which, through its management of a large forest belonging to the municipality, was able to conduct its municipal activities without any taxation, owing to the income from the timber. The matter has been referred to by some of the daily papers of our larger cities and attention called to some desirable features which might be carried out in this country. For instance, the city of Los Angeles has had larger acreage in one body given to it for a city park than has any other city in the world. In this body of land are several thousand acres of land which could be planted to eucalyptus or other trees which in time would be a very large factor in bearing the expense of municipal government and, at the same time, answer admirably the purposes to which the park was dedicated.

# Agricultural Notes of the Pacific Coast

## Northern California

Early table grapes have been in light supply.

Canners at Healdsburg are paying only nine dollars per ton for tomatoes.

The red spider has injured many hop yards along the Sacramento River.

Work has begun on the levees of the new reclamation district just north of Sacramento.

The California fruit distributors recently sold 62 carloads of fruit in one day at various eastern points.

The Chico cannery which is the property of the California Canners' Association will not be operated this year.

The Sacramento Valley Development Association is taking every opportunity to make known the advantages of that section.

Green decidduous fruits shipped this year have commanded on an average from three to four hundred dollars more per carload than was received last year.

At a recent meeting of the Calaveras-Alpine Stock Association it was decided to encourage the improvement of the range in the Stanislaus National Forest.

P. H. Dorset, founder of the plant introduction garden at Chico, has been appointed chief of the government plant introduction department. W. W. Tracy is in charge of the Chico garden.

Apple growers of southern Humboldt county have organized for the sake of securing better returns for their fruit. One factor of the work will be inducing members to be more careful in growing and packing.

A strong company of Eastern capitalists has purchased the holdings of the Central Counties Power Company and other interests, and it is rumored it will expend ten million dollars in developing water in the Sierra Nevadas.

Articles of incorporation of the Geyserville Prune Growers Association have been filed. The first directors of the company are: George H. Larkin, E. Moody, F. A. Cook, C. R. Miller, Victor Seeman, S. H. Young and W. S Vaughan.

Experts from the State Agricultural College have been experimenting for the past two years in the Castro Valley near Haywards in the growing of belladonna. It is reported that two crops a year may be secured and an aggregate of ten tons per acre for the season.

Since Gridley and Chico have sprung their quarrel as to which has the largest oak, other counties are coming in and setting up their claims. Mendocino county now claims she has one thirty-two feet in circumference which it is estimated would make seventy-five cords of wood.

At the recent annual meeting of the Sutter County Almond Growers' Association, bids for this season's crop were received. The bid of the Guggenheim Company was accepted but prices are not mentioned. It is understood, however, that a material advance over last year's price has been offered.

## Central California

Corcoran sugar factory is slicing 325 tons of beets per day.

Dinuba Farmers' Union is building a packing house for handling fruit.

A large increase of acreage of alfalfa is noted at Turlock this year.

The farmers' union is shipping actively of the cantaloupe crop from Turlock.

The Tulare county Eucalyptus Timber Co. will plant 480 acres to eucalyptus trees.

Beets delivered to the sugar factory at Corcoran this year have ranged as high as 24 per cent sugar.

Visalia grape growers began shipping seedless sultanas in carload lots as early as the middle of the month.

The farmers' union claims that it will handle from 1500 to 2500 cars of San Joaquin Valley melons during the season.

The arrest of a creameryman at Dos Palos, Merced county, for making improper returns for cream resulted in his acquittal.

It is rumored that the farmers' union has 40 cars of raisins stored in various eastern points awaiting more satisfactory market conditions.

Dinuba sent out eleven cars of melons in one day last week. The shipment would have been greater if it had been possible to secure empty cars.

Representatives of six farmers' institutes and co-operative unions, meeting in Turlock recently, decided to erect a packing plant for deciduous fruits.

The perfecting of the organization of the state farmers' union has given fresh interest to the securing of new members, and many are now joining who had formerly refused.

One hundred and twenty-five wagon loads of melons were delivered in Dinuba in one day, and at one time a string of wagons two blocks long was waiting a chance at the scales.

At a recent meeting of the board of directors of the Turlock Irrigation District, land was acquired for a right of way for a new canal for extension of the irrigation system.

The Pacific Coast Trotting Horse Breeders Association meet and the twenty-seventh annual exhibition of the Monterey District Agricultural Association opens in Salinas August 4th.

The report that the California Fruit Canners Association would not operate their Hanford plant this year is denied, and it is now claimed that it will take care of a large quantity of fruit.

Much interest has been manifested in the planting of orange groves in the past year in eastern Fresno county, and the foothill sections which are eligible for citrus planting are now in demand.

Great interest is being shown by farmers in the experiments of Prof. Shaw in developing a new wheat of the bearded type which, under ordinary circumstances has yielded at the rate of 63 bushels per acre. This wheat has been tested by a number of farmers in the vicinity of Arbuckle, Williams and Maxwell during the last season, over 3,000 acres being grown.

## Southern California

Imperial Valley cantaloupe sheds are now being changed over into grape packing sheds

Imperial and Coachella Valleys imported 42 expert women grape packers from Fresno county.

An improved road from Banning to Idyllwild is considered by the supervisors of Riverside county.

The lemon growers of Highland are discussing the building of a scientifically constructed lemon house.

Dumps for the cheaper handling of beets have been erected in nearly all beet growing sections of California.

Experts of the State University will investigate mealy bug menace and it is hoped a remedy may yet be found.

Seedlings and sweets are practically all shipped leaving the field open for Valencias for the rest of the season.

The grass fire near Lake View, Santa Barbara county, destroyed hay to the value of nearly $10,000 last week.

The state organizer of the farmers' union is in Imperial endeavoring to form a local branch of the organization.

The Lima Bean Growers' Association of Ventura county is practically organized and ready for the coming campaign.

The Imperial Valley Bee Keepers' Association has an offer from Germany for ten cents per pound for the output of the Valley.

Lemon men are pleased at the fact that the conference committees of the Senate and House have united on the one and one-half cent lemon tariff.

A representative of the Missouri botanical gardens is in California studying the various cacti collections and has visited the one at Riverside.

Many irrigators heretofore connected with the Imperial Water Company Number One, propose to segregate their holdings, forming a new company.

The plant disease laboratory at Whittier will continue during the coming year its investigations as to an English walnut immune to bacterial blight.

There is a very good prospect of a fine crop of walnuts in and around Santa Barbara and Goleta, and there seems to be no evidence of blight that can be noticed.

It is reported that this year's walnut crop will not exceed 75 per cent of last year's. The blight proved to be much worse than was anticipated earlier in the season.

An effort is being made to perfect an olive growers' association of the growers at Santa Barbara and Carpinteria. They held a meeting last Saturday with that object in view.

Some cabbage growers of the Imperial Valley are loud in their opinion that the fruit and produce company that has handled their output for this last season has buncoed them.

A movement is on foot by which it is hoped to increase the amount of water used by irrigators of Orange county. It is simply the development of greater capacity in the canal from Santa Ana Canyon.

## The Coast

The new crop of hops is promising to bring good returns this season.

Heavy rains at Wallowa, Oregon, caused the lodging of much wheat.

Colfax, Washington, reports that the harvesting of wheat will be begun about August 1st.

Idaho is agitating the question of separating the agricultural college from the state university.

Some of the largest apple growers of Washington report excellent outlook for the apple market.

Placer county is to vote upon an issue of bonds in the amount of $125,000 for road improvement.

The first of this season's wheat to reach Portland was unloaded at the elevator there on July 12th.

Investigations are being made with the idea of establishing a beet sugar plant at Redding, Shasta county.

Cherry growers at Clarkson and Asotin Washington have netted a fortune from their product this year.

The Philippine Islands produce coffee of fair quality but not sufficient for local consumption and much is imported.

The state dairy inspector of Washington has closed two slaughter houses until they can report in more sanitary condition.

The wheat yield of Washington, Oregon and Idaho is estimated by the Portland Oregonian to reach 55,000,000 bushels this year.

Apple shippers of Washington and Oregon maintain that their fruit has commanded higher prices in Germany than fruit from any other state.

Over 3,000 acres of pineapples are now growing in the Hawaiian Islands and it is estimated that within a few years there will be 10,000 acres in bearing.

The Alaska wheat which bobbed up last year as such a fake proposition is again before the people because of the promoter donating large quantities of it to millers to grind into flour.

James J. Hill of the Great Northern reports the crops of eastern Washington as exceptionally heavy this year, and that freight cars will be at a premium to handle the immense crops.

Wild grasses have so overrun some plantations of the Philippine Islands that former cultivated lands have been deserted and it has been found more economical to reclaim wild forest land which has not been infested with the weeds.

Speakers representing the apple growers of the Walla Walla Valley, Washington are canvassing the apple growing sections of the state, agitating against the enactment of the Lafean bill which attempts to establish a size of box different from that heretofore used on the Pacific Coast.

An acre of pineapples in the Hawaiian Islands produces as first crop about ten tons; the second or ratoon crop will bear about twice that amount. Cannery prices this year year have ranged from $20 to $27 per ton. Some fruit shipped to the Pacific Coast has averaged as high as $200 per ton for the fresh fruit.

**FOR MOULTING HENS**

**Feed**

**MIDLAND**

**Poultry Food No. 4**

***$1.95 per Sack***

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.

***Petaluma Incubators and Brooders***

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Governor Gillette has appointed J. R. Murphy of Fresno member of the state dairy board.

# Profit in the Poultry Yard

By Mrs. Frank Metcalf

**We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.**

### Indian Runner Ducks.

How many Indian Runner Ducks could I raise on one acre of ground? Into how many pens should an acre be divided? How large should the runs be for each pen, and on what plan should it be built? How high should the fence be around the pens? Would it be best to plant fruit trees or grow alfalfa in the pens? Should there be a stream of water running through the pens for the ducks to swim in? What time of year should the eggs be hatched? What rations should be fed at all times?—J. A. B., Hanford.

The number of ducks that may be raised upon an acre of ground would keep a man pretty busy, for they do not require very much room to roam about when small and are usually disposed of at ten weeks of age to the best advantage. If I had the laying out of an acre of ground I should sow one-half of it to alfalfa for green feed, and make pens for my breeding stock and young birds on the other half which would be 100 feet by 200. Ten females and a male constitute a breeding pen, and each pen should have a yard at least 25x50 feet, which would take 100 feet square for eight pens. In each pen should be sunk a half barrel or a cement tank for water, if running water is not available. A handy way to arrange for cleaning these as described in Mrs. Basley's Poultry Book, is to take a barrel and saw it in two unequal parts, one twice as deep as the other. The end containing the hole is the smallest end, and the other has the head knocked out and a place dug for it in the ground. Then the other piece is set inside, and filled for the ducks. When cleaning time comes, the plug is pulled out, and the water sinks down into the cavity below, where it drains away without causing filth or trouble. The plug is then replaced and fresh water turned in for the breeders, which is a necessity for their health.

These yards must be frequently swept and fruit trees should be planted in them to provide shade. A duck house need not be very large, and may be quite low, as they sleep on the ground, and one four feet wide by six long should be large enough for each pen, open on one side. The fence need not be over three feet high.

From February to July is the best time to hatch, as eggs run more fertile then than later. For the breeding birds, feed three parts wheat bran, one part corn meal, five per cent beef scraps ground fine, five per cent grit and one part quaker oat food, with all the green feed they will eat, which may be corn fodder, oats, or alfalfa, cut very fine. While laying, more cornmeal may be fed, and turnips, potatoes or carrots boiled and fed cold, with cabbage chopped fine and oyster shells and grit always before them.

For the young ducks, no water is required excepting for drinking. The first food may be hard boiled eggs chopped fine shells and all, mixed with dry bread crumbs and chopped onions, sprinkled liberally with coarse sand. This sand is the most necessary part of their first food, and must be mixed with it, so they cannot eat without getting some of it. The second day a little rolled oats and bran may be added to their ration and a little finely cut clover, lettuce, or cabbage may be added, not forgetting the coarse sand. At ten days old the food should consist of three parts wheat bran, one part alfalfa meal, two parts corn meal, ten per cent beef scraps, and the same of green feed. Plenty of grit should always be used. At eight weeks old, feed equal parts bran and cornmeal, with a little rolled oats and beef scraps, never forgeting the grit, but no green food, and at ten weeks they should be ready for market, plump and tender. They should be fed four times a day until six weeks old, then three times will do, with water at each feeding. After six weeks they should have water between meals. Feed only what will be eaten up clean at each meal, never leaving any to sour. Keep the pens dry and clean, and be sure to give shade. The sweeping from the yards should be put upon the alfalfa, scattering it well over at each cutting.—Mrs. F. M.

### Worms.

I have noticed in dressing the last few chickens for the table, that there was a worm in them about two inches long. What shall I feed to rid them of this? They have the run of the orchard. I feed kaffir corn and cracked Indian corn and they seem lively and healthy. I found, too, that our fox terrier dog has worms. What remedy can I use and how shall I administer it? He is very averse to medicine, and we can scarcely get anything down him. What shall I put in his bath water to kill fleas?—Subscriber, Redlands.

Sulphur is a good remedy for worms and is easily administered to the chickens by mixing thoroughly in the mash, a tablespoon to a pint of whatever wetting is used. A little salt is also advisable, helping the system to throw off the worms.

For the dog, there are advertised remedies to expel the worms, but if the sulphur can be gotten down him in any way, it will help him, as well as the chickens. Maybe he would eat worm candy. For the fleas, a two per cent solution of creolin will rid him of fleas, if he is bathed thoroughly in it. A string saturated with oil of pennyroyal tied about the neck is said to keep them away, but I have never tried the latter on our dog. Salt and water is good to bathe dogs in for fleas, and is always cheap and handy, and very objectionable to the flea gentry.—Mrs. F. M.

### Trouble With Chickens.

My neighbor has two hens that have hard lumps, just like warts, on their combs and gills, also on their eyelids. They cannot open their eyes unless we wash them out occasionally. They have none on their bodies, and their combs are red and they seem perfectly healthy otherwise. Will you please advise what causes this and what can be done?—Mrs. S. E. M., Hemet.

This acts like chicken pox, which is a sort of fungoid disease, said to be caused by too much starch in the food. Wash the places with warm soapsuds, to which is added a few

drops of carbolic acid, and anoint with carbolic salve. Feed a little sulphur and chopped onions. Separate and watch for symptoms on the well birds, as it is very apt to be infectious.

### Sluggish Liver.

What can I do for my full blooded Barred Plymouth Rocks? No certain age seems to be exempt. They begin to droop, get weak in their legs, want to isolate themselves. What passes from them looks like part sulphur. Upon opening the dead ones I found something wrong with the liver. Sometimes it would be of abnormal size, broken and would fall apart at a touch. Sometimes it would be a little larger than natural and filled with hard, yellow lumps. Have killed several ailing ones and found their livers in the same condition as I have described. They have the run of the ranch, plenty of clean water, gravel, oyster shells and mortar, some burned bone, green stuff from the garden, wheat headings, (unthreshed), to run to whenever they wish and plenty of shade. Are housed in houses 8x12, with about 36 in each house. Hoping to get help through your valuable paper, which has helped me many times before.—H. W. B., Pixley.

Too much wheat will almost invariably cause this liver trouble, as I have found to my sorrow in days gone by. A vigorous physic is necessary to act upon the liver, and a good pill should be given to each bird, and the diet regulated at once. Try and keep them from the wheat heads for a while, if possible, and if not, feed them a mash composed mostly of bran and cornmeal in the proportion of one-third cornmeal to two-thirds bran, in which you may mix a teaspoon of cayenne pepper to every gallon of mash, and moisten with skim milk if that can be had. If they fill their crops with this early in the morning, they will not be so apt to get too much of the wheat.

I never had this trouble with fowls running at large, but only when confined closely, and in that case used to make catnip tea by the gallon and mix leaves, stems and all, in the mash, which would correct the trouble very nicely. Barred Rocks are naturally great eaters, and are the most liable of any breed I ever handled to become too fat for their own good, if given all they will eat. This makes them excellent for the table, but is hard on the liver, as they will not take enough exercise if fed too lavishly on rich food.

If the flock is a very large one, and the pill not easily administered, mix a liberal supply of sulphur and molasses, and wet the morning mash with some of this, an old-fashioned, but excellent remedy for sluggish livers. The proportion should be a tablespoon of sulphur to each pint of molasses.—Mrs. F. M.

### LIMBER NECK

Soon there will be a clamor to know what produces limber neck. Limber neck is an ailment affecting poultry of all kinds, characters, and ages. Sometimes the head will be twisted clear around; at other times the head will hang down, bending the neck against the body as though it were a useless portion. The fowl attacked goes stumbling about like a crazy person with fits. This is a fair description of limber neck.

This is the result of eating putrefied meat full of maggots. When the putrefied meat and maggots get into the crop, they grow and increase, propagated by the natural heat within. Being alive there is no possible chance for them to be passed from the crop into the gizzard and destroyed. They live in the crop, irritating it, and causing the ailment known as limber neck.

To prevent this ailment attacking the poultry, never allow any dead animal or fowl, or decayed meat, to lie about and become putrefied. If eaten by dogs or children this will produce fits or death in them the same as with poultry. If there is no putrefied meat and maggots for them to eat, there is no danger of limber neck.

When the fowl is attacked with this ailment, as quick as noticed, take up the fowl, gently pour a tablespoonful or more of turpentine into the crop, and work it gently about with the hand. Pour a sufficient amount of warm water into the crop to fill it as full as possible. Hold the fowl up by the legs, head down, over a box or barrel partly filled with earth, and gently work the entire contents out into the box or barrel. Again repeat the dose and wash out the crop a second time. Follow this with a tablespoonful of castor oil, and place the fowl in a box or coop by itself, where it will speedily recover or die. It is scarcely worth while to spend much time doctoring the common run of poultry. Better destroy them and burn them and burn their bodies. Never leave anything about that might cause this disease. The contents of the barrel or box and the barrel or box itself should be burned. —The Feather.

---

We never have been able to determine why the all-wise Creator made the rat and endowed him with such a ferocious appetite for little chicks, but he's with us, appetite and all, and unless we watch out he will create havoc with our early hatches and, possibly, make us say things that would not look well in print. Use every precaution to protect the chicks from rats.

---

Don't fool away time on that weakling or sick cock. Chop off his head and put your money into a good one. It is economy in the end.

Coulson's POULTRY FOODS

**Growing Chick ...Food...**

Can be fed damp as a mash or dry in hoppers. Feed it to your chicks up to 3 months old. Gives rapid growth and health.

It will save your grain bill, and you cannot afford to be without it.

**EGG FOOD**

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

For sale by dealers everywhere. Write for our free book "Poultry Feeding for Profit" with samples of our Poultry Food.

# Bees and Their Care

By Henry E. Horn, Riverside

### TREATMENT OF FOUL BROOD.

FOUL brood, the most common form of contagious bee disease and by far the most disastrous, is so widely distributed that it may appear at any time in localitles now free from its ravages. This condition of affairs makes it very important that all persons keeping bees should have a knowledge of the symptoms of this disease, so they may be able to detect it, and properly treat it, before it shall have devastated their yards.

In the advanced stages of this disease the colony becomes weak and listless, and upon opening the hive a very disagreeable odor will be noticed, resembling somewhat the odor from the melting of a poor quality of glue. In lifting the combs out of the brood nest, it will be found that a large per cent of the unhatched young bees are dead in the cells.

Those that have been sealed over will have the cappings sunken and perforated, causing the comb to have a ragged and uncomely appearance.

The dead larvae, if punctured with toothpick, will draw out in a ropy thread like melted glue or rubber. This dead larva finally dries up into a tightly adhering scale, which sticks to the lower cell wall so tenaciously that the bees are unable to remove it. These dried down scales may be seen by holding the comb in such a position as to admit the rays of sunlight directly into the lower part of the cell. In the earlier stages of this disease, all these symptoms may not be noticeable, possibly only a few cells may contain dead larvae.

But the ropy consistency of the decaying larvae and the disagreeable odor peculiar to this type of disease, furnish an almost unmistakable key to the diagnosis of American foul brood.

Dead larvae from other causes will have a bad odor, which is simply that of decaying dead bees, and the decaying matter may have a very slight tendency toward ropiness but hardly noticeable. Such symptoms, as these, arising from chilled, starved, overheated or polsoned brood, shoulc not be hastily judged to be foul brood, a thing that the inexperienced is too likely to do. If at any time symptoms of bee diseases are found that create a suspicion, and doubt is sustained as to what the real trouble is, then the inspector should be notlfied, giving him as complete a description of tne trouble as possible.

European foul brood (often called black brood) is a form of disease resembling American foul brood in some respects. The comb will have that repulsive and haggard appearance. The brood that has been sealed will have the sunken and perforated cappings. But the larger per cent of the the dead larvae will remain unsealed. The dead larvae, when touched with a stick, do not show the ropiness found in the American type. There may be a very slight tendency toward ropiness, but it is not very pronounced. The odor in this disease is that of soured dead brood.

When the dead larvae become dry, it is in the form of an irregular scale, which does not stick so tenaciously to the cell wall as that in the American type, and the bees sometimes succeed in cleaning them out, and the disease apparently disappears. This disease ls more likely to affect drone and queen larvae than the American. Dead larvae in a sealed queen cell, sometimes are the only evidence of disease having been ln that hlve, others having all been cleaned away. European foul brood is considered by many to be more infectious than the American and to spread faster.

For the treatment of foul brood, both American and European, the following known as the McEvoy treatment, slightly modified, ls a safe and efficient method:

In the honey season, when the bees are gathering honey freely remove the combs in the evening and shake the bees into clean hives; give them five or six frames with comb foundation starters and let them build comb for four days. The bees will make the starters into comb during the four days and store the diseased honey in them, which they took with them from the old comb. Then in the evening of the fourth day take out the new combs and give them comb foundation (full sheets) to work out, and then the cure will be complete. By this method of treatment all the diseased honey is removed from the bees before the full sheets of foundation are worked out.

All the old foul brood combs must be burned or carefully made into wax after they are removed from the hives, and all the new combs made out of the starters during the four days must be burned or made into wax, on account of the diseased honey that would be stored in them. All the curing or treating of diseased colonies should be done in the evening, so as not to have any robbing done, or cause any of the bees from the diseased colonies to mix and go with the bees of healthy colonies. By doing all the work in the evening it gives the bees a chance to settle down nicely before morning, and then there is no confusion or trouble. Everything should be made ready beforehand, so when the proper time comes the work can be done quickly.

Caging the queen while the bees are on the five or six strips of foundation helps to prevent the bees from deserting the hives.

In burning diseased combs, they should be burned after night in a pit dug ln the ground, so that there will be no danger of honey running on the level surface. If combs are heavy with honey, the application of a little kerosene will hasten the burning. After the burning is finlshed, replace the fresh dirt, covering all from sight, thus preventing robber bees from carrying off honey that might not be sufficlently heated to kill all germs of disease.

Do not burn good hives. They can be very cheaply and easily disinfected by lightly painting the inside surface with gasoline or kerosene, and then applying a match. If too much oil or gasoline has been used and the hive or hives are likely to be injured by the burning, close them up tightly and smother the flames out.

When diseased combs are to be worked into wax, they should be melted ln boiling water, as sun heat is not sufficient to kill the disease germs.

This method of treating foul brood can be carried on at any time durlng the mild weather when bees are not gathering honey, from the opening of spring until late in the fall, by feeding plenty of sugar syrup late in the evening, to take the place of the honey flow. Great care must be exercised in this, not to start robbing. —Exchange.

When Rolls The Oregon.

---

One Interesting feature of the bee business in Massachuetts is the use of bees in the greenhouses where cucumbers are produced. Their work on the blossoms "sets the crop." It is estimated that considerably more than 1,000 colonies of bees are used for this purpose in a year. As the bees can secure very little nectar from cucumber blossoms, the colonies become weakened and either die or become a prey to moths.

---

Farmers of the San Joaquin Valley are between the deep blue sea and the other fellow in the law which controls poisoning of ground squirrels, and the state game and fish commission which warns them that they must not at the same time poison other game.

### YOUR CHILDREN'S EDUCATION.

It is always a puzzling question as to how much education a boy or girl can take that is the best kind, and where to secure it. Psychology teaches us that the mind is moulded along diversified lines and that no two minds have the same receptive power, nor the power of grasping the same thing with equal force. Some minds grasp art, others music, but the large majority can readily grasp the principles of commercial practice.

Perhaps you want your boy to be a farmer and follow in your furrow. Perhaps you want him to enter the professions, or possibly you want him to enter business. Whatever course you choose for your son or daughter the essentials of business must be grasped before real success can be made.

The world is struggling too hard for the weak men and women to reach the top. Education is the deciding factor in the measure of strength, which is the measure of ability. As one is better fitted to do things that are needed to be done, just that much surer is that one of making a success in life.

The Polytechnic Business College of Oakland, has long given its attention to the needs of young men and women and has fitted thousands for successful careers. For the past ten years it has placed every student who has taken a complete course in a position of good salary with excellent opportunities for advancement. This school issues a beautiful and completely illustrated catalogue, giving a description of the various branches it teaches. The book will be sent free to those who mention the Cultivator.

# General Agriculture

### ALFALFA AT THE STATE FARM

THE State Farm at Davis is not only proving a factor in the education of the youth of the state, but its experimental grounds are developing some grains and grasses under the experiments directed by Prof. Shaw which may increase the wealth of the producing class so as to give vast dividends on the money invested in the land and equipment of the state farm.

Regarding the alfalfas observed by Prof. Shaw, he writes us:

We have had several types of alfalfa under trial on our experimental stations, particularly at Tulare, for several years past. Among these types are Chilean (which is the common variety grown by farmers), French, German, Turkestan, Peruvian and Arabian. There are at least three of these which offer advantages over the common or Chilean, in respect to rapidity of growth, particularly the French, Turkestan and Arabian. Our experiments, not only upon our own station but also on several experimental plantings which we have secured in many parts of the state have shown that the Arabian type is the most rapid grower of any type which we have tried. It will ordinarily make about twenty-five per cent more growth during the season than any other, except the Turkestan, and I should say about ten per cent more growth than the Turkestan. It has other features also which commend it very highly. It is more leafy; has a much larger leaf, and does not become as woody and hard in the stem as do any of the other types, and this is a great point in its favor. It recovers very rapidly after cutting and makes a considerable growth during the winter. From the first of December until the middle of February, it will make, under the conditions at Tulare, a growth of about eighteen inches, while the common, or Chilean type makes a growth of about six, or eight inches. Wherever the climatic conditions are not too severe, I consider it a much superior type of alfalfa to the common, or Chilean.

It should be remembered, however, that this alfalfa is more easily injured by heavy frost than either the common, or the Turkestan types. We have had it under trial in sections, ranging from the Imperial Valley to as far north as Stockton, and the result has been uniformly good.

The Turkestan variety is a more rapid grower in the summer than the common, and is adapted to regions where the water supply is limited, although by this I do not mean that it will thrive under extremely dry conditions. It will stand more frost than the common, or Chilean, and in general makes about ten per cent more yield.—G. W. Shaw, Berkeley.

---

Alfalfa, like corn and cotton, demands certain conditions of the soil and certain constituents in that soil. Every crop demands certain foods. All crops except alfalfa and the other legumes obtain practically all their food, including nitrogen, from the soil. The latter crops use nitrogen but get it from the air. Alfalfa takes nitrogen from the soil only during the first few months of its growth, and thereafter not only takes its own necessary supply from the air, but a large surplus which it stores in the soil, available for whatever crop may follow. Other crops take much nitrogen from the soil, but contribute nothing to its enrichment.—From Coburn's "The Book of Alfalfa."

---

### INDIVIDUALITY IN FARMING

Success in agricultural pursuits depends as much upon the individual in charge as does success in any other vocation. But many lose sight of this fact. They attribute the success of others to better farms, or better luck.

The successful farmer does have a better farm than his unsuccessful neighbor, but it is not the lay of the land that is responsible—though of course a man of good judgment will choose the better location. On a level stretch of prairie with only a wire fence between, one farm will improve and the other decline in productiveness and value. It is the individuality of the two farmers that accounts for the difference.

Some men are born managers. They can handle men and get the most out of them. They can work out plans to a successful conclusion. Everything they do seems to be successful. It's in the man. Luck has nothing to with it.

Some men are not born managers, but they have the gumption to profit by experience, whether their own or others. They make up by a close study of problems what they lack naturally. Others never see their lack and never try to grow in judgment and skill.

The man who is a successful farm manager is apt to be a leader in the community. You find him conspicuous at the institute and grange. He has his say at the school meeting and everywhere. Some dislike him for this. But say, how much stock do men take in the advice or leadership of the unsuccessful man?

Fortunate is any community that has in its midst a few very successful men. Fortunate indeed if those men do not take advantage of their ability and override the rights of others less favored.—Successful Farming.

---

### TYPHOID FLIES

Beware the fly! Already in our midst the house fly, the dirty fly, the typhoid and cholera infantum fly, has begun to swarm in thousands and millions, unless precautions are taken. The house fly, whom we were taught in our childhood to treat with kindness, has been exposed. Its habits are filthy. It breeds in stables and garbage pails and carries the filth it revels in and tracks it across the sugar, the butter and the beefsteak. It paddles its horrid feet, gummed with the vilest rotting matter, in the baby's milk. The doctors have declared war on the house fly. It probably disseminates every disease. It is a nuisance. It must be exterminated. It can be driven out of every city. In an age of knowledge, screens and cheap disinfectants there is no excuse for flies in any household. Clean up your premises and report to the health department your neighbor who does not. Get rid of breeding places of flies and you will get rid of flies.

There is no family so poor it cannot afford to screen its home. Screens will turn away all flies as well as mosquitoes. The unscreened house, in other words, is a dangerous thing, and screens on windows and outside doors are an excellent investment from several points of view.

### Garget.

My cow has just calved and has developed a small hard lump which stays against the end of the teat unless squeezed, and partly prevents the milk from coming out. We put the calf on that teat but it did not seem to help matters. The lump does not seem to hurt unless squeezed tight, but cannot be forced out.—A. K. S., Imperial.

The trouble is garget. Handle the quarter carefully so as not to make it inflame any more. Fomenting with hot water will help it even now. I would at the first have given her a good big dose of Epsom salts, a pound at least with a tablespoonful of ginger added to it. This might not be amiss even now if the udder is inflamed at all. Milk as carefully as possible and try rather to keep the trouble from increasing. The udder excepting the affected quarter should be milked out clean, then the calf will milk out the affected quarter. It helps the cow, but is rather hard on the little calf to be made to take in all this bad milk. A milking tube can be used to draw off the milk, but must be used with care so that the udder is not infected with foreign matter. Sterlize by baking it in an oven and then putting it carefully into a bottle of carbolated vaseline, handling by the ring end and never touching that part that enters the teat.

These troubles often pass away when the cow freshen next time, so that it may be best to let the affected quarter go dry until she comes in again.—M. E. S.

### Pasture Amongst Eucalyptus Trees.

If a pasture is planted to eucalyptus trees twenty to thirty feet apart, can hay be raised on the same ground until the trees are large enough to cut? Would rye grass thrive or would these crops retard growth of the trees? At what age should trees be cut first?—Subscriber, Sebastopol.

If the trees were planted as far apart as you suggest, the pasture might be of value for the first two or three years. Ultimately it would be affected by the shade of the trees, and we do not believe would be as profitable as it would be to devote the entire field to the one purpose and plant more thickly to trees. The rainfall in this state is too light even in Sonoma county. The trees could be planted six or eight feet apart and then the poor or slow growing ones removed at the end of two or three years, and the remainder, if still too thick, further reduced by cutting for poles. The age for cutting depends upon soil, amount of rain fall, and to a certain extent on the amount of culture for the first two or three years, and especially upon the use to which the timber is to be put. If the trees are planted more thickly, you will secure straighter timber of greater commercial value. If planted thirty feet apart, the trees will have a tendency to branch.

### Nitro-Culture.

Will the use of nitro-culture accomplish what the advertisers claim in increasing the crop yield, i. e., two to ten times?—L. F., Sebastopol, Cal.

The benefit from the use of nitro-culture depends entirely upon conditions. For instance, if you were planting peas in a field where peas had previously been grown, the soil would doubtless be sufficiently supplied with the bacteria beneficial to the crop so that the addition would be of no advantage whatever. If, however, they were to be planted on virgin land, or on land which had been planted to other crops, the use of the bacteria would very probably be of benefit. Whether it would ever increase the profit ten times, we would very much doubt, but if it simply doubles the crop or increases it by a slight percentage, the small expense of treating the seed would be more than covered. This may be done by the cultures offered by certain seed houses or by securing them from the department of agriculture, or, as is often done, by taking soil from fields which heretofore have successful crops of the same kind. Bear in mind that the particular bacteria which are beneficial to peas might not be of any benefit to alfalfa, though both are legumes.

### Yellow Jackets.

I am sending you my remedy for the yellow jacket pest. It is very simple, safe and effective. Make a syrup of sugar and water, boiling a little fruit of some kind in it for the flavor. Prunes are very good and the yellow packets like them. Fill wide mouth bottles from one-half to one-third full of this syrup and place them where the yellow jackets are most troublesome. They will leave the fruit for the syrup and hundreds of them will become meshed in it, and can then be scalded.—Mrs. P. Knolloch, Smith Creek.

On the deciduous page of this week's issue will be seen another communication regarding yellow jackets, with description of remedy.

### Castor Beans.

What time of the year should castor beans be planted? Will you please give information as to planting for commercial purposes? In the August number of the Technical World, there is an interesting article on castor beans. I will much appreciate any further information.—R. T. Clyde, El Monte.

We have noted the article in question and also some comment which it has occasioned. It is somewhat at fault in not locating the hero of the castor bean story so that we can get further information as to where the beans were marketed. At one time a mill was started in Southern California, and while there was no cost for securing the beans other than for gathering them on wild land, the mill could not even pay enough to encourage picking, so it soon ceased to operate. Where the beans may be forwarded to market we are unable to say, and until a market is assured, the prospective planter should be very slow in making a start in castor bean culture. As we do not know of their having been planted except for ornamental purposes, we have never heard of any established rule of procedure, unless that given in the "Technical World" is correct. If we were to plant them, we would do so in April or May, and we would, under no circumstances, plant, as recommended in the magazine in question, in the Colorado desert section where the rainfall may be less than one inch. There are many points in this article which make it look as if its author were writing of an imaginary venture.

### Peaches Not Bearing.

I have an orchard of four year old trees, large, well formed and healthy, which bear only a scattering crop. Next year I wish to get more of a crop. What time of the year does the tree set its fruit buds? Would it be better to do part of the pruning right after the picking of the fruit so as to give the rest of the tree more strength to set buds? A few of the trees this year were affected with curl leaf, and these are more heavily loaded than those which were not. The pruning has been done under the directions of an old orchardist.—A. K., Kerman.

It is possible that the failure of your trees to bear is because of the inherent nature of the tree. You do not say what variety of peach you are growing. Again, the trouble may

**Sept. 6th -- Big Hatch**

be with soil conditions, though from the tone of your letter we take it there is abundant summer growth. It is barely possible, as you suggest, that summer pruning would be of value. At least, we should experiment along that line. The majority of the trees we should not cut back heavily, but by checking the outer growth more sap would be thrown to the fruit spurs thus inducing the formation of more fruit buds. The fruit spurs form on wood of this year's growth. We would not cut back to the extent of this year's growth, but only a small part of it. It is very probable that the trees you speak of having been more seriously affected by curl leaf are of a different variety from those which bear so lightly, and this fact may account for the difference in their crops.

### Fertilizer For Gravelly Soil.

After reading the article in your issue of July 15th, under the heading of "The Handling of Intractable Soils," I am impelled to ask you for suggestions as to the best methods of handling light, sandy and gravelly soil, set to oranges. This soil varies in depth from twelve inches to thirty-six inches and is underlaid with "wash" gravel, rock and clean sand, into which the roots do not penetrate.

My own conclusions are that all the vegetable matter which can be worked into the soil, should be put into it, to make it more retentive of moisture and to induce lateral percolation of water when irrigating. I use barnyard manure and barley straw. I also use shallow furrows to assist lateral percolation and cultivate not deeper than about four inches.

I have not used cover crops during the two years I have owned this place, believing that straw would give quicker results in improving the mechanical condition of the soil, and that when this result is obtained to a degree, cover crops could probably be grown to better advantage.—W. N. Glasscock, Rialto.

Your method is correct unless it be in the matter of adding straw. It appears to us that the application of straw to gravelly soil would make it very hard to retain moisture. If put on in the fall and given sufficient rainfall during the winter, it is possible it would decay and be in good condition for the coming summer, but otherwise excepting as a mulch on top of the ground, we should much prefer to keep it out of such soils. The green manure crop would be preferable and we should apply superphosphates or some commercial fertilizer to stimulate as heavy a growth of the green crop as possible. If straw is to be used, we should surely run it through the stable and throw it in the compost heap and at least let it partially decay before putting it into the soil. Of course the need of such a soil is the addition of humus and every possible method should be used to increase the humus content. Unless there is an abundance of humus, the moisture goes through the soil to the coarse gravel below and the little retained soon evaporates. Humus is your salvation.

### More Pruning.

Will it hurt peach trees to prune them during the summer? They do not bear fruit yet.—A. W., Parlier.

See answer to A. K. in this issue. You do not state how old your trees are. If young, we would prune very carefully in the summer. Older trees may be cut back at the tips, but we would not give a young peach heavy pruning.

### Bermuda Pasture.

I noticed a reference to Bermuda grass in one of your articles in the Cultivator. I have some alkali soil that is sub-irrigated from a ditch. Have been experimenting and have succeeded in getting bermuda to grow in some spots. I have found that large sods live where small ones will not, that it will grow in some places without irrigation, or when standing for several days in alkali water, while in other places it quickly dies out. I should like to put a large field in bermuda for permanent pasture. Any information you can give me about how, when, and how deep to plant it will be thankfully received.—J. C., Hanford

We secured twelve years ago a complete stand of bermuda grass on a meadow too wet to grow anything else. This field today is a good one and carries a large amount of stock at all times. We plowed and harrowed it as for corn, or about five or six inches deep, then made shallow furrows about two feet apart and about two inches deep, dropping the cut up bermuda into these furrows and covering at once with the plow. After a month's time the field was given surface irrigation. In two months it was green all over, though showing greater density of green down the furrows. The next season the rows had disappeared completely, and ever since the field has been a completely covered mat of sod. The cuttings should be sown as quickly as possible and kept moist until covered with the earth. We got better results in this way than in making a lawn where great care was exercised, and sods carefully cut were laid down and kept well watered. The sod died in the centers and grew on the edges, leaving a piece of dry dead stuff to be removed from each sod. The joints seem to run out and root better than the older established roots themselves. In taking bermuda out of a vineyard we do not consider the old roots of as much importance as these runners in spreading it under the vines. In the alkali spots, if a little sand is put into the furrows or under the sod until the roots have a chance to form, they usually will take hold. The mischief that alkali does is that it burns the first growth. I have gathered stems of bermuda that were encrusted with alkali for several inches while the top of the shoot was green and healthy. Any spot that proves too strong may be started by putting on a little land plaster to neutralize the acrid surface. I would also secure some salt bush and mix that in with the bermuda. This grows wild in some of the bermuda country, having escaped from the cultivated fields. If you do not know the plant, some of the neighbors may possibly show it to you. I hve seen it growing around Tulare City, on the roadside, and in waste places. The salt grass found in the river country is worth growing for meadows. On the best portions of the field brush in a little alfalfa seed. This mixed up meadow feed will satisfy the appetite of cattle better than only one grass. The amount of stock that a well set bermuda field will carry is amazing and the grass keeps on growing. Let it rest for a couple of weeks and it is again ready to furnish feed. The worst side of bermuda is the ease with which it takes possession of the cultivated lands and the expense attending its removal. When the horses are turned out on bermuda pasture and then caught up to work, if great care is not used, they carry the joints of grass in their feet and finally plant it in the cultivated soil. Bermuda likes a loose cultivated soil and is very slow in spreading on uncultivated land, while it will travel by its long runners over plowed ground for long distances in one summer. As a grass it is a summer grower and does not furnish much winter feed. The stock, particularly horses, will eat it down to the roots in the winter and may be able to spoil the next season's grazing by being kept on it too long.—M. E. S.

### Smoking Out Squirrels.

I am having a great deal of trouble with squirrels. Please give me particulars about how to use the smoker, where I can get it and what is the price. Have you experience in destroying gophers?—F. G., San Jose.

Yes. Squirrels are thrifty enough to soon discover the land that has no smoker on it affords better food for them. I would try to interest the neighbors in a squirrel raid if possible. However I have for years sent my men on the adjoining places and smoked the squirrels whenever the runs were near enough for the squirrels to be feeding on my crops I have never had any one object to this proceeding on our part. The smoker does better work in the winter time when the ground is moist enough to retain the smoke well. The smoker is merely a tin pump made with a spout and handles. The smoke is forced into the open holes and rises out of any that are connected by a runway. These are each stopped in turn and then the machine is worked rapidly until the hole will not take in any more smoke. The spout is quickly withdrawn and the hole stopped up. A small stick with a white flag made of a strip of muslin is placed at the side of the hole to mark it so that in the next round it may be examined to see if the squirrels have opened it up again. It is strenuous work pumping in the smoke and a good man must do the work or it is useless. The dead bodies of the squirrels in the holes seem to make it unpleasant afterwards, so that outside squirrels do not dig into the old runways.

The gophers on the ranch that escape the cocker spaniels are drowned out.—M. E. S.

## Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

### MISCELLANEOUS.

## THE TOWN OF "USED-TO-BE."

Grandma lives in a funny place,
The town of "Used-to-be,"
Where streets are "turnpikes," and people are "folks,"
And a nice hot supper a "tea."

"Where is the town of 'Used-to-be?'"
In grandma's memory bright,
"The way?" Upstairs, to grandma's room
(The cosy one to the right).

"When can you go there?" Twilight's best,
For the gleamy glow in the grate
Lights the way to the town of "Used-to-be,"
And nobody need to wait.

Then ho, for an hour in the dear old town,
And hey, for the husking-bee,
And oh, the dancing in stiff brocade,
And ah! the trysting-tree.

And ugh, the sermons, two hours long,
And three of them, Sabbath day,
In a "meeting house," so cold and drear,
Where the "foot stove" held its sway.

But if grandma shows you a summer scene,
In a farm house and orchard fair,
With rows of cheeses on dairy shelves,
And bees in the clover-sweet air,

And there beyond, in the kitchen wide,
Grandma, herself, at the wheel,
Spinning, singing, a fair young bride
You say, for you can but feel—
"What a dear, dear town of 'Used-to-be!'"
But grandma's voice drops low,
And she says, with a half-sad, half-sweet smile:
"'Twas all so long ago."

—Boston Transcript.

## ETHEL'S ODD WAYS CAUSE HOURS OF WORRY.

"DEAR me!" said Ethel's mother as she paused in passing that young woman's open door. "What have you got your pink dress out for? You aren't going anywhere tonight."

"I—I'm fixing it," said Ethel, hurriedly. "The lace is ripped."

"Oh," said her mother, in surprised gratification. Perhaps, after all, Ethel was going to prove self-helpful and careful. That young person at the moment was answering a telephone call.

"I'm awfully sorry, Mabel," she was saying, "but I can't come. It's so kind of you to ask me. Yes, I have another engagement for tonight."

"Why, I thought you weren't going anywhere!" her mother called in surprise.

Ethel frowned. Sometimes one's family was very trying.

"I'm not," she said. "But I didn't care to go to Mabel's and I had to tell her something because she hangs on forever. Besides, it wasn't exactly a fib. There's lots of time to make a dozen engagements before this evening. I believe I'll run around the corner and get a manicure."

"You can do it nicely yourself," said her mother.

"They do it better at the shop," said Ethel carelessly.

When she came back an hour and a half later and removed her hat she discovered a well-dressed head freshly waved and puffed.

"I thought that as I was there I might as well have my hair looked after," she explained to her mother. "I believe in taking care of one's hair."

"I didn't know having it curled was exactly an incentive to its growth," said her mother. "It seems to me you're wasting a lot of time on yourself today just for the family's benefit. If you aren't going out and nobody is coming—"

"I'm surprised at you, mother!" said Ethel severely. "I hope I'm just as careful of my appearance before my relatives as before strangers. You've always preached that at me and now—"

"Yes, I know," said her mother, apologetically. "By the way, we might go over to Cousin Anna's this evening."

"We-e-el," said Ethel, protestingly. Then she turned reproachful eyes on her parent. "You know father doesn't enjoy going there, and really, mother, I don't think it would be right for us to leave him all alone at home for a whole evening."

"I never knew you to be so thoughtful before," said her mother in self-defense. "If you'll remember, you literally dragged me out to that church concert last week—the night Mr. Grassmere brought us home."

"You ought to get out more," said her daughter. "I'm sure it was a very enjoyable evening—program, I mean."

When she came down to dinner Ethel had on the pink dress. "I thought that as I had it out I might as well wear it," she explained. "Besides, it won't be any good when summer comes."

"Gee!" said Ethel's small brother. "You're fixed up to beat the band aren't you? Hair curled and everything! I bet your fellow's coming!"

"Tommy," said Ethel with sad patience, "the way you use common slang is something dreadful! If you only knew—"

"Is he?" persisted Tommy maliciously.

"Is who what?" demanded his sister in an irritated tone. "It does seem to me that I might have a little consideration shown me by members of my own family! Mother—"

"Tommy, eat your dinner," said her mother. "Ethel, you are unduly sensitive."

"I've got to go back to the office tonight," said Ethel's father, "and work on that case again."

"Then Ethel and I can go to Cousin Anna's," said her mother.

"My head aches a little," said her daughter, pensively. "I don't believe I feel like going this evening."

"Gee!" said Tommy ten minutes later. "Whatchu turning down all the bright lights in here for? You can't see a thing with all those pink shades on and everything?"

"You'd better take your book into the den," said Ethel soothingly. "It's lots more comfortable in there, really. You can curl up on the couch."

"If you didn't have that dress on," said her mother, "we could go through those trunks with the summer things packed in them this evening. What are you going to do?"

"Oh, I don't know," said her daughter, who was wandering around the rooms restlessly. She stopped before a mirror and surveyed herself. "Do you like my hair this way as well as the other?" she asked, intently.

"It looks all right," said her mother. "You're so queer tonight, Ethel.

I can't seem to find anything you want to do."

There was a ring at the door and with a soft pink swish Ethel herself flew to open it.

"Why, Mr. Grassmere!" came Ethel's voice in well-modulated tones of surprise. "I'm so glad to see you!" She spoke as one who of all things on earth least expected to behold that young man.

Ethel's mother's eyes happened to light on the calendar on the library table. A great light broke. "If I didn't forget it was Friday night!" she breathed. "And he's been here every Friday night for two months! Well, that explains it."—Chicago News.

# About the House

### ESSENTIAL TO GOOD DRESSING.

To always look well-dressed on almost nothing a year, a woman must know how to keep her garments in order. Not only must one know how to do it, but it must be done promptly. There is no other way. If you think, "I'll let this go for a day or two, and have a great renovating seance some time in the future," you'll look shabby and untidy most of the time.

A black silk dress is quite indispensable to women who must dress economically. This does not sound economical at all, but it really is. I know from experience. I saved pennies, and looked like a tramp, until I had achieved a black silk gown, and I've never regretted it. I purchased a good piece, and it has stood so much hard wear that if I were to tell about it, most of you wouldn't believe me! I had it made very plainly, and in a style that was most becoming; then I wore it for ages without remarking it. You can do that if your dress is becoming and not in any pronounced style. But black silk, even of the best quality, soon becomes old-looking if not properly cared for. It should never be brushed, and it should never be hung away with the least bit of dust on it. Yet it shows dust so quickly that one is always tempted to use a brush. Instead, the dust should be carefully wiped off with a flannel cloth. A black silk gown can be worn on so many and on such varied occasions, that one who has such a gown need never fear that she has nothing to wear. After I had achieved my black silk, I worked for a cream wool gown, and these two gowns, with cheap dimities, ginghams and percales made me a well dressed woman in our neighborhood for five years. I had a dimity evening gown that cost me five cents a yard, and was one of the most effective gowns I ever had.

Mud stains can usually be removed from silk of any color by rubbing with a piece of flannel. But if too obdurate, try a bit of linen moistened with alcohol.

To renovate crepe, brush it free from dust, then wet with alcohol and roll it over a long round stick, keeping a piece of paper between each fold of crepe. Fasten it with a pin, and stand it away until it is perfectly dry, being careful that it does not rest aginst anything for it easily becomes flattened when damp. Let the top of the stick rest against the wall, but not any portion of the crepe. I have renovated the crepe-finish goods used for gowns, in this way, when I wished to make them over. If not badly soiled, crepe can be cleaned by holding it over steam, then winding it over a stick.

Black lace is easily made to look like new by dipping it into whisky. If it has an edge, pin it out so that all the points are in perfect shape. If you are careful, you can make one set of lace trim several gowns.

Chiffon should never be ironed; but it may be pressed with a heavy iron if placed between several thicknesses of sheeting. When washed, it should never be rubbed. Let it soak until clean in weak suds of white soap, if very dirty. Stir it around, occasionally, but do not rub or wring it. Rinse it by changing the water until you are sure all the soap has been removed, then take it out and hold it up in the air, allowing it to drip as long as it will. It is then ready to press. I have a friend who folds hers until it is as large as the bottom of a roasting-pan then she places it between folds of sheeting, puts the roasting-pan over all, and fills it with boiling water. This water is changed once or twice, and by that time the chiffon is pressed. In this way, she gets even pressure, and the advantages of heat, without using an iron.—Fruit Grower.

### HOW TO WASH SILK.

In washing silk there are four things which must be avoided, and they are soap, heat, rubbing and wringing. Have the water lukewarm. Make a lather with a little dissolved soap if the garment is dirty. If the article is not soiled much, use bran water. Don't ever allow soap in a lump to come in contact with silk. Take one end of the article and swish it around and around until it is clean. Rinse it in cold water to which vinegar has been added. Add one tablespoonful of vinegar to one quart of water. Place the garment between dry cloths and squeze, preferably between a wringer. Then shake well to get rid of all superfluous moisture and iron at once through tissue paper with a warm iron.

THE SCHOOL OF OPPORTUNITY

Polytechnic Business College
306 12th Street, Oakland

PROSPERITY COMING

The Great Demand for Stenographers and Office Help Means Better Times.

Over 200 Recent Graduates of the Polytechnic Business College of Oakland Take Commercial Positions.

One of the best possible indications of returning prosperity is evidenced by the unusual demand for stenographers and trained office help in the various departments of commercial activity.

The report of the Polytechnic Business College, 306 12th St., Oakland, for the term ending June 30th, shows that over two hundred young men and women have been sent to commercial positions in the vicinity of Oakland and San Francisco during the past six months. Within two weeks after the graduating exercises were held every graduate of the full course had been placed in remunerative employment. This is not only an indication of the improvement in general business conditions, but it clearly shows the trend of the times and the growing popularity of commercial education.

This institution, established but ten years ago, is today the largest and most effective business training school west of Chicago. Its plan and policy is to maintain the highest standards in business education and to offer a more thorough and practical training than the ordinary business college.

The College is planning for the accommodation of a large enrollment of students the coming year. On account of its high standing and practical work many young people of the various Pacific Coast States are being attracted to Oakland.

The Polytechnic College is generally conceded to be the leading school of its kind in the West and has the endorsement of leading educators including high school principals and university professors.

Parents who cannot send their sons and daughters to a four-year high school course and university, should consider well the opportunities afforded by this institution.

Many of these graduates are receiving from $50.00 to $75.00 per month to begin with, and are located in positions where promotion and advancement may be steady and sure. It costs no more to attend the Polytechnic than it does the average business college and its advantages are many times greater.

Students are coming from all sections of the West and the College will open with a very large attendance in all departments.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

White comb .....14@15
Light Amber .....10@12
Extracted W W .....7@8
Extracted light amber .....6@7½
Beeswax per lb .....24@28

### Hay.

Extreme prices for hay which have prevailed in Portland and other northern points tend to give a very strong tone on the local market.

Scott & Magner say: Arrivals for the week have been 4400 tons, which is quite an increase over last week's arrivals. Prices for the week have continued along in about the same condition that they have been in, except that there is an additional feeling of weakness, and on some days sales were made at lower figures to effect the movement of the hay from the cars. The consumers generally are not buying their hay for winter use, as it is apparently impossible to bring them to feel that prices demanded are justified in any way by conditions in the country and the quantity of hay that has been harvested.

A few cars of fancy wheat hay have been sold this week for retail purposes at prices above our topmost quotations, but the majority of the wheat and wheat and oat hay that has been arriving has been selling from $14.50 to $16.50 per ton. There is more tame oat hay coming into the market now, but this type of hay does not move off as well as could be wished, as the high prices limit the sale to a large extent.

There has not been much alfalfa hay coming in, although there has been plenty to supply the current demand, and the market on this article has remained about as last quoted.

We quote the general range of prices on today's market as follows:

This week's quotations are:
Choice wheat hay .....17.50@18.50
No 1 wheat or wheat & oat 16.00@17.00
No 2 wheat or wheat & oat 14.00@15.50
Choice tame oat .....16.50@17.50
Other tame oat .....13.00@14.50
New crop wild .....12.00@15.00
Stock hay .....8.50@10.00
Alfalfa .....10.00@14.00
Straw .....60@75

### Grains.

Wheat No 1 .....2.02½@2.07½
Barley .....1.40@1.45
Oats white .....1.90@2.15
Oats gray .....2.00@2.10
Rye new crop .....1.40@1.45
Corn Egyptain .....1.60@1.65
Corn Cal sm round .....1.80@1.90
Alfalfa seed, Cal .....16@18
Mustard brown .....3¾@4½
Millet .....2½@3
Flaxseed .....4
Broom corn seed per ton .....23.50

### Feed Stuff.

Bran per ton .....29.00@30.00
Feed cornmeal per ton .....39.00@40.00
Cracked corn per ton .....40.00@41.00
Rolled barley per ton .....31.00@32.00
Rolled oats per ton .....40.00@41.00
Oil cake meal per ton .....38.50@40.00
Cocoanut cake per ton .....25.00@26.00
Middlings .....36.00@37.50
Mixed feed per ton .....26.00@30.00
Shorts .....31.50@33.00

## Deciduous Market

SACRAMENTO, July 24, 1909.

Yesterday's sales of California citrus fruits in the East aggregated 82 cars. Chicago took the greatest number of these which was 17. Other cities took from 3 to 13 cars. The prices realized ranged as follows:

Chicago—Bartletts, $1.95; Wicksons, $1.20; Tragedies, $1.15; Washingtons, 90c; Germans, $1.02.

Boston—Bartletts, $2.05; Wicksons, $1.65; Tragedies, $1.45; California Reds, $1.30; Deckers, $1.05; Crawfords, 80c to $1; St. Johns, 80c to 90c.

New York—Deckers, 1.05; Wicksons, $1.37; Tragedies, $1.37; Bartletts, $2.50; Crawfords, 90c.

Philadelphia—Duane, 1.40; Bradshaws, $1.35; Bartletts, $1.80; Washingtons, $1.30; Wicksons, $1.65.

Minneapolis showed only fairly satisfactory returns, Burbank plums $1.20; Sugar prunes $1.20 to $1.25; Tragedys $1.35; Satsumas $1.40; Bartlett pears an average of $2.00.

Pittsburg handled three cars, Bartletts commanding an average of $2.15; Wickson plums an average of $1.65; peaches an average of 85 cents with market showing an upward tendency.

## Citrus Market

LOS ANGELES, July 28, 1909.

Seedlings, sweets, Mikes and other than Valencia oranges are now practically out of the way, and it is well for they hardly commanded sufficient price to cover cost of picking, packing and freight. Valencias of regular sizes and first class fruit are commanding very satisfactory returns. Some off quality fruit is commanding but little better prices than the seedlings. With severe culling it is probable the remainder of the fruit may be disposed of at satisfactory prices.

The lemon situation is anything but satisfactory. There are at this time 214,000 boxes of foreigns afloat. At same date last year there were afloat only about 155,000 boxes. Yesterday's sales in New York aggregated over 30,000 boxes and 70,000 are in hand yet to sell. California is forwarding about 40 cars per day, and unfortunately some of it is not of the highest grade and these in competition with the foreigns, which this year are showing up exceptionally well, make a situation which only some extremely warm weather over the east can correct. Prices have been shaded within the past few days at least a dollar per box.

### Shipments.

Total shipments to date this season, 33,861 cars of citrus fruit, of which 28,729 were oranegs, 5,219 lemons. To same date last season, 26,903 cars of which 23,001 were oranges and 3,902 lemons.

NEW YORK, July 26.—Seventeen cars oranges, two part cars and one car lemons sold. Market unchanged on oranges, steady on lemons. Weather clear and favorable.

Alfalfa producers at Vale, Oregon, are cleaning up $50 to $150 an acre on alfalfa seed.

## A LIVING PRICE FOR FRUIT.

(Continued from Page 102.)

are in the ring that hold the prices up to the consumer and down to the producer.

The fruit that goes there from our packing house is usually what we know will not carry for a long distance market, and are glad to sell it in block crates or in the shipper's crates at a lower cash down price. You see if you send in good fruit it comes in competition with this sort of goods. We find it is best to pack the regular commercial crate with the two or four baskets according to the size of the bunches or clusters of fruit. The market understands the regular package and will buy it in that way most readily. As to letting the grapes stand to wilt, that of course depends on the time of the year. Whenever the bunches will bend without the stems breaking, particularly the short pedicles that hold the berries to the stems, the fruit is fit to pack.

The packing of the Emperors begins anywhere about the 11th of October and lasts two weeks. Malaga packing comes next month, Sultanina (Thompson Seedless) will begin within ten days at most of the houses. It would be impossible to tell you how to pack a crate of grapes in approved commercial style. Go to the packing house and do the work for a few days, then you will have gained the knowledge necessary to do good work. I should go to the nearest commercial packers and secure a guarantee on prices of so much a crate. Here at present the companies are guaranteeing on Malagas a price of from 25 to 35 cents a crate over expenses of packing. This company will send a crew of girls out to the vineyard to pack, if it is within hauling distance of a place where they board. If there is a large enough crop to bring families to camp, the labor can be secured for both picking and packing. The name of the ranch is usually on one end of the crate and the name of the company handling the pack on the other end. Sometimes when you have not full carload lots the advantage of having the company pack the fruit comes in the fact that they have other small lots and can fill the cars promptly, sending them off without demurrage.

There are orders coming f. o. b. to these larger companies that have to be filled and this removes all elements of the gamble, though I have not had red ink in twenty years of shipping fruit to the East. I think every year it will surely come to me. —M. E. S.

---

It is Shakespeare who says, "A jest's prosperity lies in the ear of him that hears it, never in the tongue of him that makes it." Be this as it may, there is "prosperity" in a jest. It soothes distress, aids digestion, and more than song, or dance, or wine, helps to "drive dull care away." It was care that killed the cat, and it is care that is killing the American people. We must laugh more if we would have active livers, healthy diaphrams, and live long as a nation. Hence, we say, there is prosperity in a jest.—James R. Gilmore.

---

### THE LIGHT IN THE HOME.

When the shadow of night has wrapped its mantle of darkness over the earth, all nature sleeps. Man seeks to prolong his hours of day that he may reap additional benefit.

The old oil cup, which our forefathers guarded so carefully was replaced by the tallow candle. This was a great stride in human progress. It gave more light and less smoke than the oil cup. But the candle was replaced by the lamp which shed a light several times more brilliant than the candle.

Improvements have been constantly made upon the lamp until the most perfect and satisfactory lamp of today burns with no odor, no under shadow, no smoke and but little heat. Such is the Angle Lamp, sold by the Boesch Lamp Company, of San Francisco. It gives a pleasing mellow light which is very restful to the eyes. It is easy to operate, and no trouble to keep clean and to fill. It is more economical than the ordinary lamp and its light producing power is far superior.

An illustration on page 117 shows the general style. A complete catalogue, which will be mailed free, gives full details and shows the latest designs. The prices are extremely low.

When writing for this catalogue you will do us a favor by mentioning the Cultivator.

### HOLIDAY NUMBER.

The leading article of the August Century, the Midsummer Holiday Number, is Mr. Richard Watson Gilder's "Grover Cleveland: A Record of Friendship," a sympathetic appreciation of the personality of Mr. Cleveland as revealed in an intimacy of many years. The reminiscences will extend to some three instalments in The Century Magazine. In them Mr. Gilder records a friendship of twenty-one years, extending from the time of the famous tariff message in the first term to the ex-President's death. These papers constitute the most intimate description of Mr. Cleveland's life and character and personal traits—as President and ex-President, at work and at play—that has yet been given to the world.

60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it fails to do this, **any** money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

## Cotton King Disk Harrow

This harrow is symmetrical in design and strong enough to withstand the heavy work which a disk harrow encounters in a field. It is equipped with three steel standards, which insures great strength and will not clog when working over freshly-plowed ground or among clods. It will work equally well in any condition of soil, no matter whether the field is sandy or soggy. The gangs respond promptly to the levers so that the driver can easily adjust the disks to work at any desired angle. The frame is high and the disks can be so extended that there will be ample room for passing the plants when using the harrow as a cultivator. The levers do not extend below the tongue where they would interfere with the plants being cultivated. This disk harrow is just what you need. Come and investigate.

# Walnuts in Interior California Valleys

## A Paper Writen by a Keen Observer and Practical Worker with Walnuts, Mr. Claude D. Tribble of Elk Grove

HAVING made a study of the English or Persian walnut varieties in the interior valleys, the writer begs to give the reader the benefit of his observations and experiments. It seems now only a matter of time till we have our Walnut Growers Associations and have a full share of the joys and woes in the business.

It has been demonstrated that the California black (Juglans Californica) and its hybrids with the Eastern black (Juglans Nigra) are the only roots that can be used for stock to graft on, owing to their resistance to heat and to their withstanding the excessive water in the soil during the winter and spring months.

**Planting Seed.**

The seed should be planted in the sprouting bed as soon as taken from the tree and left till they commence sprouting, when they must be transplanted to the nursery row where they should be planted eight inches apart in the rows and the rows four to six feet apart and planted about three inches deep.

At two years the trees will be ready to bud or graft—(some at one year) or if preferred they may be transplanted to the orchard to be budded or grafted later. Nothing should be used but the most vigorous seedlings as the others will make poor dwarfy slow growing trees. In transplanting cut back the top to 24 inches and shorten the tap root from one-third to one-half.

**In Nursery.**

The nursery should be thoroughly cultivated, keeping it free from weeds. Good, deep ditches are necessary for irrigation and they should be so that the ground is moist at all times. Cultivation after each irrigation will promote growth and vigor.

**Varieties.**

English walnut seedlings have been planted in the valleys for many years and there are but few of these that have merit.

The writer and his brothers have grafted over several hundred of these in the past few years, yet it is not advisable although the parties prefer to have these grafted instead of waiting for young trees to bear. One of these seedlings, the so-called Vrooman Franquette, is said to have considerable merit. It is said to have originated near Niles, California and is supposed to be a second generation Franquette.

There are but few of the known varieties adapted to the interior valleys and these are mostly of the French types of which the best known are the Franquette and Mayette.

From the writer's observation the Mayette is preferable owing to its maturing early in the autumn and escaping the discoloring caused by the fall rains which usually catch the later nuts.

The Parisienne is one of the good nuts, but usually a shy bearer, yet the writer has seen one tree of this variety that out-yields any other variety in the orchard and there are a number of varieties including the Franquette and Mayette.

The walnuts that have proven best for the coast counties and the southern part of the state, have proven a failure in the valleys, and I believe most of them have been tried and some are buying seedling and grafted trees of these varieties. They are too susceptible to our climatic conditions and sunburn.

**Develop a Better Nut.**

It is certain that some experimenter will find a nut much more adapted to our conditions than we have at present. There are many second generation nuts scattered over the valleys that are wonderful producers, but are defective as commercial nuts.

The introduced French varieties bloom late, the Franquette blooming about the first of May and the Parisienne and Mayette about the middle of May, thereby escaping the spring frosts and damp weather which is said to cause the blight.

**Grafting.**

Grafting the walnut is performed much the same as grafting other deciduous fruits and the results depend on the care of the trees and scions after grafting.

In grafting old walnut trees, English or black, we cut away all the top and use from two to six scions according to size where the limbs have been cut, using the ordinary cleft graft. The skill of the grafter has more to do with success than the methods employed. We have tried all known methods and with equal success. If the grafting is properly done and perfect care given afterwards the grafter should get 60 per cent or better in large trees and 75 to 100 per cent in small trees.

**Placid Waters of an Imperial County Irrigating Ditch.**
Courtesy Calexico Chronicle.

After grafting the scions should be protected by some sort of covering and the stock should be waxed repeatedly. Mr. Neff, of Anaheim has given a good formula for wax (in past issues of the Cultivator), also the proper kind of laths to support the growing scions.

In grafting the nursery and small trees we use methods according to size of stock and in all our grafting we have not been bothered with an excessive flow of sap.

For an illustration in covering scions (in our work this season) we used protection for 200 trees and got 80 per cent to make fine trees. In another plot 350 grafted were not protected, and we got 51 per cent.

**Budding.**

We have experimented in budding the walnut for several years and last season we made an average of 65 per cent and expect to do beeter this season. We prefer budding to grafting as the bud makes an average growth of nine feet while the scion makes an average of six feet.

Budding can be done in the fall only. We use the common shield bud and cure our buds three weeks before using. All of our spring budding has been a failure.

We cut the bud one and one-half inches long or less, tie with muslin strings and do not cut string till late in the fall or in the winter. The buds do not start till the spring following and some do not start till late in June. Ring and plate or patch buds have failed to grow for us.

**Fertilize.**

The walnut responds quickly to fertilizing with manure, it produces a rapid growth and plenty of large, well filled nuts. Alfalfa must not be planted in the walnut orchard, as we have seen it tried in an orchard that had produced a good crop of large nuts and since planting the nuts have not been half as large and they fail to bear half as much.

Interplanting with fruit trees is to be recommended.

**Diseases.**

Among diseases and pests we have the erinose of the leaf, die back and red spider (which is controlled by sulphur dust or spray). Blight seldom affects the walnut in the valleys and but little danger is done.

**Start Right.**

In conclusion we would say to get the very best root stock that you can grow and have your scions selected from the best bearing trees that it is possible to find. Remember all trees of any variety of fruit do not bear well and it is so with the walnut. If you get Mayette, Franquette or any other variety, get your scions from the best bearing trees.

Be shy of the man with seedling trees for there is not one chance in one thousand of getting what was planted. A grafted tree of good selection bears a paying crop in five years while a seedling bears a few nuts at 8 or 9 years of age, and you do not know what you will get.—Claud D. Tribble, Elk Grove.

**Pioneer ROOFING**

We tell you to put on a "Pioneer Roof," and forget it. Needs no paint or repairs. Sun proof and rain proof. Not affected by extremes of heat or cold. Suitable for all kinds of buildings—pitched or flat roofs. Comes in handy rolls. Easy to lay—anybody can do it—no special tools needed.

**Now then—Let us send you samples, a copy of our 32-page Roofing Booklet and name of our nearest agent.**

# With the Citrus Growers

## NATIONAL INSPECTION TO PREVENT IMPORTATION OF DESTRUCTIVE INSECTS.

MR. L. O. HOWARD, Chief of the Bureau of Entomology of the U. S. Department of Agriculture, has returned to Washington from Europe, where he has been engaged during the past month in interviewing paid and volunteer agents of the Department of Agriculture and the State of Massachusetts who are assisting in the importation into the United States of the parasites and other natural enemies of the gipsy moth and brown-tail moth. In the course of this work, Doctor Howard visited France, Holland, Germany, Russia, Austria, Hungary, Switzerland and England, and the results of the trip are already evidenced by the receipt at the parasite laboratory, Melrose Highlands, Mass., of a greatly increased amount of parasitized material, which is being handled at that point by expert assistants and will subsequently be liberated in woodlands ravaged by the gipsy and brown-tail moths. A great interest is shown in the different European countries in this very large-scale experimental work, and the official entomologists and others are anxious to do everything in their power to help the United States.

The brown-tail moth, it will be remembered, was accidentally introduced into this country upon plants imported from Europe. Many other injurious insects have been brought in in the same way, and the danger still exists in the absence of any national quarantine and inspection law. Such quarantine and inspection laws are in force in nearly all the civilized countries of the world, and the United States is almost unique in its indifference to this great danger. The amount of money that has been spent by the different States in New England and by the General Government in fighting the gipsy and the brown-tail moths alone would support a national inspection service for many years. Last winter there were brought into the United States, mainly at the port of New. York, thousands of apple and pear seedlings from France which carried the winter nests of the brown-tail moth. These seedlings were distributed all over the country. An effort was made, through the assistance of the custom-house authorities and the railroads, to trace all of these shipments to their destination and to secure inspection and destruction of the injurious insects before the opening of spring. It is probable that these efforts were successful, but the experience emphasizes the necessity for a national law.

Doctor Howard was instructed by Secretary Wilson to visit the leading exporting nurseries in Holland, France, and England in order to determine the efficiency of any inspection service that might exist in those countries. He found that the inspection service in Holland is excellent, as conducted by J. Ritsema Bos, of Wageningen, and his assistants. Nursery stock bearing the inspection certificate of these officials can be accepted in this country without any danger.

In France it was found that no governmental inspection service exists and that the certificates which have hitherto accompanied nursery stock from that country can not be relied upon. After consultation with the leading nurserymen and the authorities of the Ministry of Agriculture of France, Doctor Howard was assured by the Director of Agriculture, M. Vassilliere, that the French Government will immediately establish an official inspection service, under the direction of Dr. Paul Marchal, a thoroughly competent man well known for his work on injurious insects, so that in the future nursery stock coming from France and bearing the inspection certificate of the Ministry of Agriculture can be relied upon.

In England, it was found that no governmental inspection service for home nurseries exists. Officials of the board of agriculture assured Dr. Howard that it is the desire of the board to establish such a service, but that the demand must come from the English nurserymen. Members of the Council of the National Association of Nurserymen, of England, were then interviewed, and it seems reasonably certain that this influential organization will request the Board of Agriculture to establish such a service under the direction of some competent entomologist like Mr. Cecil Warburton, at Cambridge, or Mr. F. V. Theobald, of Wye.

## BREEDING UP THE ORANGE.

For the past few years the improvement of plants and animals by selection and by hybridizing has had more attention than ever before. All kinds of field crops have been experimented with. With corn, cotton, tobacco and many other crops, marked results have been attained. New fruits have been developed, and the world has been scoured to get other varieties, because of their own merits and because of possible improvement which they may bring to our established varieties.

We believe there has been less of effort at improvement in citrus fruits than with most others. It has been the impression that the navel orange and the Eureka and Lisbon lemon are so nearly perfect that little incentive has been given to improvement. To be sure, one to two "improved" sports of value have been placed on the market, but there has been no general effort toward up-breeding.

Greater care in selection of buds is observable than formerly, when any tree which was a "navel" was good enough. Today the planter of orange trees demands of his nurseryman much care in selection of buds. A few nurseymen are living up to this demand.

Now we are informed that an expert from the Bureau of Plant Industry will locate in California and endeavor to develop a higher grade of orange than ever yet produced. The gentleman is Mr. A. D. Shamel, formerly Physiologist in charge of cotton breeding and tobacco investigations of the Bureau of Plant Industry. Regarding him, Mr. J. H. Reed writing to the Riverside Press says:

"When yet a student in the University of Illinois, Mr. Shamel commenced his experiments in trying to secure improved varieties of corn. This investigation he continued till it was demonstrated that new fixed strains could be secured, greatly im-

proved both as to yield and value of content. The work was taken up by the state university under Mr. S's direction. Corn breeding stations were established, and a new era for the industry commenced. Annual millions in value have been added to that great American product, directly traceable to the work largely started by Mr. Shamel.

His special genius for this kind of work was early recognized by the agricultural department at Washington, and his services secured, which have been signally successful, especially in the cotton and tobacco interests. New types of each product have been produced especially adapted to different soil and climatic conditions, as well as to qualities most desirable for different purposes.

The greatly increased value of these important products, during recent years, is due in large degree to Mr. Shamel's work and the enthusiasm he aroused in others to carry on similar work.

This is the sort of man about to be sent to see if improved types of oranges and lemons may be secured. For one I have no doubt of his success, hence believe his coming means a vast deal for the future of our industry.

A Busy Scene in a Redlands Packing House.

Close application to his work for several years had so impaired Mr. Shamel's health that the department, fearing a break-down, sent him to Southern California last winter. He spent some weeks here very quietly, but not idly. A long time close friend of Mr. Powell's, he at once became interested in his special work and in other citrus fruit problems, especially the possibility of creating new and improved strains of fruit, which he insisted was entirely practicable."

G. Harrold Powell writes to Mr. Reed:

"You will be interested to learn that Mr. Shamel will probably give up his work with corn and tobacco and go to California to begin a study in the building up of better strains of navels, valencias, lemons and grape fruit. It is not definitely settled, but the probabilities are good. I have long been interested in the possibilities of this line of work. * * There is no better man in the country for such a problem, and if he takes it up he will give his entire time to it."

---

The farmers' union of Palouse, Washington, will operate local warehouses under the management of an experienced grain man during the coming season.

## FENUGREEK AS A COVER CROP.

The importance of cover crops for the renovating of impoverished soils, and keeping good soils up to the standard by supplying them in a cheap, and a readily available form, with that most expensive and most essential of plant foods, nitrogen, is fully recognized by all horticulturists who have given thought and study to the matter. With a lack of nitrogen in the soil, the trees, (we speak more particularly of citrus fruit trees) are wanting in vigor, the foliage pale and wood growth poor, and the fruit either in regard to keeping or any other quality, inferior to that from well nourished healthy trees. It is only within recent years that cover crops as a means of supplying the necessary nitrogen, have become at all popular, but as seasons go by and the beneficial results of this method become more apparent, growers are taking advantage more generally of this up to date and inexpensive way of keeping their groves in first-class condition. Another important element in the soil is humus, which, although not in itself a plant food, preserves the moisture and keeps the soil in good mechanical condition. This is also supplied by the cover crop in the decaying vegetable matter. Of course, to supply nitrogen, the cover crop must be a legume or pod bearing plant. All these pod bearers draw nitrogen from the atmosphere, and the bacteria in the soil store or "fix" it in the nodules that can be seen on the roots of peas, clovers, etc., and when the crop is plowed under in the spring, and decay starts, this stored nitrogen is liberated and becomes available to the trees.

Fenugreek will prove a profitable plant for the cover crop and we doubt not California orchardists will plant largely of it this fall. It has been claimed it supplies abundant nitrogen and more humus than burr clover. It is an erect growing plant, from 1 to 2 feet high, resembling clover in being three leaved, a native of Western Asia, and also quite extensively grown in the Mediterranean region, where it is used as an early fodder plant, and in parts of India as an esculent. The seed has a strong, peculiar, aromatic odor and is used in preparing stock foods, and is also used in the making of curry powder. As a cover crop, it may be sown in the fall, at the rate of 20 pounds to the acre broadcast, or 10 to 15 pounds drilled. Plowed under in spring in its vigorous growth, fenugreek will amply repay the orchardist for the small outlay, in an enriched soil and healthy, fruit bearing trees.

# You Can Be Independent on the Water Question

WOULDN'T you like to have your own independent water supply? Wouldn't you like to have all the water you want just at the times when it is convenient for you to use it?

Wouldn't it be a happy condition not to be dependent on the company ditch or the favor of the water superintendent?

Then, adopt the safe and sure method of irrigation by pumping. Hundreds of farmers are coming around to this modern way of irrigating.

Some are building individual reservoirs on their own land and are filling them by pumping the water.

Others are irrigating direct from the water they pump from running streams or low-lying lakes, wells and sloughs.

## Irrigate by Pumping Water with An I. H. C. Gasoline Engine

The modern, powerful I. H. C. gasoline engines make all this possible.

Farmers find that they not only make sure of all the water they need just when they need it, but they find it an economical way to irrigate.

You will have no trouble in learning to operate one of these engines. They are simple and easy to understand and they require but little attention.

For general farm purposes there are many styles and sizes of I. H. C. gasoline engines:

**Vertical** 2, 3 and 25-horse power.

**Horizontal** (stationary and portable) 4, 6, 8, 10, 12, 15 and 20-horse power.

**Gasoline tractors** 12, 15 and 20-horse power.

**Famous air-cooled** 1 and 2-horse power.

**Famous skidded engines** 2, 3, 4, 6 and 8-horse power.

**Also a complete line of Famous mounting engines from 2 to 20-horse power, and sawing, spraying and pumping outfits and jacks.**

You cannot do better than investigate the matter. The International local agents will supply you with catalogues and full information on the many sizes and styles of engines.

Or, if you prefer, write direct to nearest branch houses.

**Los Angeles, California**

# EUCALYPTUS
## Rostrata and Tereticornis Only

This company offers 1,500,000 seedlings of the above varieties for sale for **FALL PLANTING.** We have 5,000,000 seedlings in our large nursery at Tulare, California, the major portion of which are grown for our own use.

The authorities are rapidly coming to the opinion that the Fall planting is the best and we venture the belief that in a short time Spring planting will have become a thing of the past.

Our trees are grown by Prof. D. C. Burson, a noted forester of forty years' experience, which insures the best possible product. Seedlings are inured to all weather conditions and are strong and vigorous trees 10 to 12 inches in height.

**WE INVITE THE CLOSEST INSPECTION.**

Orders only received subject to prior sale.

# Deciduous Fruit Culture

By J. W. Mills

### A VALUABLE PLUM.

AN express package arriving at this office recently, brought with it such a delightful odor of the orchard that it was instantly noticed by all in the office. It soon proved to be a package of plums from the San Joaquin Valley, containing three varieties, Formosa, Gaviota and Santa Rosa. It is needless to say that the plums were sampled and pronounced upon most favorably by the entire office force and by a number of orchardists who chanced to call while they were here. As a rule those sampling the three varieties placed the awards of merit in the order following; Formosa, Gaviota, Santa Rosa, but declared the poorest or rather the one of lesser merit to be exceptionally fine fruit. The Formosa is a large red colored sweet plum which compels all who taste it to take notice that it has a future.

The plums were sent to the office by Mr. Geo. C Roeding of the Fancher Creek Nurseries and regarding them, especially the Formosa, Mr. Roeding writes:

"I visited Mr. Burbank last Friday, and made a rather careful inspection of his grounds. Of all the plums he has growing at Sebastopol, and the assortment is certainly an immense one, I do not think in the entire collection there is anything which will touch the Formosa plum. The tree is an unusually vigorous and thrifty grower, sends up heavy stocky shoots covered with a luxuriant growth of foliage, the leaves being so large that on the first glance, the tree has the appearance of a cherry. The fruit is of unusually large size, and this is the case even where trees are heavily loaded. Mr. Burbank has a number of trees grafted over throughout his grounds at Sebastopol, and in no case was there a tree to be found which was not laden down with fruit, although other varieties in the immediate vicinity were void in many cases of any plums.

"The flavor of these plums is unusually rich, and even when dead ripe, there is absence of cloyness so often found in the American types of plums. The Formosa is unquestionably an improved Wickson. The shape is almost identical, but the flavor, color of the skin and the quality of the fruit will undoubtedly cause this plum to supercede such well known varieties as Wickson and Kelsey, which have been so popular for shipping purposes. There is no question about this variety being very much earlier than Wickson, because I saw Wicksons on the Sebastopol grounds, which were not even fit for shipment at the time of my visit. For eastern shipment, these plums can be picked in Santa Rosa on the 15th of July, and in the San Joaquin Valley, the period of ripening would be at least ten days earlier Another noticeable feature about the fruits is that they all practically ripen on the trees at the same time.

"The Santa Rosa plums were practically gone at the time of my visit. This variety is considerably earlier thn the Formosa and is ripe enough for shipping purposes the 1st of July. It possesses an aroma found in no other plum. There is a slight acid taste just beneath the skin of this plum, that might be objected to by some, but for my own taste, I consider it very attractive, and to many people who object to fruit, which is over-sweet, this plum will undoubtedly prove very popular.

"The Gaviota is just getting in condition to ship. Its large size and fine flavor will undoubtedly cause it to be in demand after it has fruited in different sections and its merits are fully understood. The pit of this plum is exceedingly small. This season for some unknown cause, the pits are more or less defective. This is the first year in the several years that I have been watching the fruit, that anything of this kind has been found.

"It would require too much time to go into detail as to the many other things which Mr. Burbank is experimenting with. He claims however, that within a few years he expects to have some valuable prunes, and he already has some new cherries, which judging from the reports of their sales this year, as well as the information which has been received from one of the growers at Vacaville, who has one of these varieties, promise to create a sensation when they are introduced. It will be sometime before they are offered for sale, as just at present there is not sufficient wood available to commence propagating them.

"You will probably be interested to learn that the Wonderberry about which there has been so much discussion in agricultural as well as daily papers of late, has more merit than has been credited to it. The plant is undoubtedly an improved Solanum negrum. The practical difference between the two however is, that the common night shade produces berries which are really nauseating to the palate, so much so that even if they are not very poisonous, very few would attempt to partake of many of them, while the Wonderberry, although it does not possess the flavor of some of our raspberries, blackberries, etc., -nevertheless has suffi cient flavor so that I could not resist the temptation of eating a couple of handfuls. Mr. Burbank assured me in his simple and unostentatious way, that they were good, and I must say that I had to agree with him. In the vicinity of the patch of Wonderberries, he had some of the ordinary Night Shade growing and a bite into one of these berries was sufficient. I did not attempt to sample them any further. It remains to be seen whether the Wonderberry has any commercial value. Still there is no denying the fact that it is not the fake which some publications have represented it to be, providing the seeds reproduce plants like the parent stock which I saw at Mr. Burbank's.

"The experience which Mr. Burbank has had with this berry is only another illustration of the extreme care necessary on the part of the originator of a new fruit to be sure of its merits before offering it for sale to the public. The very prominence of a man in Mr. Burbank's position is sure to cause him to be severely grilled should there be any possible question as to the quality and merit of his introductions."

# Live Stock and Dairy

By Mrs. Minna E. Sherman

**Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.**

## VALUES GAINED.

IT seems one of the wise provisions of nature that the qualities developed in the dam pass most readily through the blood of her sons to the next generation. This is wise for two reasons; first of all the heifers have a chance to regain vigor and strength, while the male animal can produce so many more of the improved type than could be grown through the female side of the line. The latest confirmation along this line is in the failure of the hens laying two hundred eggs a year to transmit that quality when the strength and stamima were not kept up by breeding in from the male line. In this case the size and therefore the vigor of the young pullets was noticeably less than that of the unregistered stock of the same breed. Had the pullets been selected for vigor and strength, and then bred to the male birds, we would expect to fix the type of great egg production, but only by holding up the strength of the birds. It is not easy to breed improved types beyond a certain point because of the barrier Nature puts up to the reduction of the strength. It is easy to wipe out improvement in the hands of the unskillful, for all gains must be maintained by the greatest care. The improvement is slow and yet there is an improvement going on all the time.

I sometimes think it is well for the health of the human family that the man raising the food is hampered by the fact that if he does not keep up the vigor of the animals they simply die out on his hands. This experiment station experiment of the egg producing fowls is interesting. It shows merely that all the science known will not make a breeder of a man. He must have the Art, the higher inspiration, the ideal in his mind, and breed to that rather than by fixed mechanical rules. Now take Mrs. Basley. Her hens did not run out to scrubs, but remained vigorous as well as great producers until she sold them. She has genius. It is as rare in breeders as it is in poets. The fact that in our Agricultural and Live stock shows the man whose money can buy the prize winners receives the ribbons, has been a detriment. The breeder of a prize winning animal should also have a certificate and be recognized. While the prizes and money encourage the fanciers, the real man of genius, the breeder, is lost to view. The fancier spends his money to exhibit, and I would say, "give him the money and ribbons but recognise the breeder as well." Fanciers can be found on every hand, but the great breeders are limited in each generation of men. To see that this is true, one has only to consider that as soon as any strain of a breed becomes fashionable it is run out by the incompentent hands that exploit the name for the money value it carries.

The further fact must be considered that the dairy sire with a high producing dam behind him may fail from lack of prepotency. This is the name given to the intanglble power of being able to pass on the good qualities, so that the succeeding generations will be as good as the preceding ones. Prepotency—this is a very strong word. Potent, producing great physical effect or strength. Pre, meaning the before strength, also carries an added meaning of being very strong in passing along the ability of the breed. The minor meaning of the word potest comes out in Heraldry where on the shield it stands for overcoming, overwhelming. While one may blame the mother of a cow for being what she is, the mothers of the human race must be respected, and only when the human mothers have happened to be particularly good have the signs in Heraldry been carried out to the end. In the dairy herd the poorer blood is overwhelmed and the intense virile qualities that carry the improved type overcome the colder blood.

### Improvement.

Now in a common herd of cows if the sire is prepotent, the improvement begins at once, for the heifer is half one thing, straight in the blood of the sire. If he is prepotent that half may overwhelm the poorer or colder blood at once. The other half of the cow's blood is either cold or beef blood. Now, sometimes, in a cow that is half beef, the inheritance may run to beef. It often occurs that a cow will be a good producer for two or three years and then by liberal feeding take on the beef character. This has occurred in the herd on the ranch where the dam was a good looking short horn and the sire a full blooded dairy animal. There was inheritance in both directions strongly brought out. The next cross on the dairy blood gives a cow that has only a quarter of cold blood and the next cross a sixteenth and then a thirty-second and then a sixty-fourth. By the time this is reached the cows will have practically no cold blood left and if the poor ones have been culled out the herd will be a fine one. In a hundred years from now, the improvement brought about by the Cow Testing Associations will make the herds of common cows bred up in blood and performance to be equal in performance to the blue blooded herds. The pedigreed stock breeders have felt this coming and are now linking performance with pure breeding. The orders of merit, advanced registry, and the different named classes that are backing up the blood line of the cows must now be won on performance. "To be" is no longer enough in dairy doings; "to do" has been added.

### Doing.

I doubt if there is a sound cow of full blooded dairy stock in this state, receiving a full amount of feed, that will not produce three hundred pounds of butter a year. I have never raised one that would not do it. If there are any that do not do this well, the owners should put them

out of their herds, selling them as scrubs at any price without registration papers. The ability to produce butter fat has been well held up in California by the protein character of alfalfa. Alfalfa is equal to bran as cow feed and we have fed it lavishly in the past years. When it was cheap the cows received little else, and an unskilled feeder was not at any loss, for with alfalfa to feed the cows must be very bad indeed not to return a profit. Now another era has come and we must study the cheapness of the feeds that are bought. The unskilled feeders are selling their herds as they cannot make any money out of them. Alfalfa hay at the present prices must be supplemented by corn, sorghum and grain. The common cows around Fresno, with proper feeding, will make two hundred and fifty pounds of butter and many of them are doing better.

These cows usually show either Holstein, Jersey or Durham blood; only a few scrubs are seen in the dairy herds. I have the pleasure of seeing the worst scrub in the country tied along the road as I go to town, and sometimes I think she should be photographed to add to the collection of famous ones I have as a contrast.—M. E. Sherman.

### GOOD AIR IS FOOD.

The Bible says: "Man shall not live by bread alone." He must have water clean, pure water. If he drinks poisoned water, it will bring sickness and maybe death. He must have air, clean, pure air. Water is food; air, is food. If he breathes foul, poisoned air, he will slowly poison himself, just as surely as if he drank poisoned water or ate poisoned bread. The ravages of tuberculosis are waking up the people to an understanding that they have been poisoning themselves and their animals by poisoned air.

Why is there so much more consumption in northern climates than in the tropics? Because, owing to the cold, people shut themselves and their cattle up in tight rooms and poison the air until tuberculosis ensues. What do the physicians prescribe to cure it? Plenty of pure air. Air is food, or it may be poison. Let us get that idea squarely into our minds, so we can see it in all its bearings. We northern people, one-half of the year, think only of one thing, that is heat. We must be comfortable even if we do breathe poisoned air. We look at the coal bill only and bring on all sorts of sickness to swell the doctor's bill.

If we would construct our houses and stables right, it would cost us but little more in heat for pure air and we would be saved a vast amount of disease in our families and herds.

We must think on these things more than we have done. We must spend a litle more time in getting our minds right on this question and a little more money in making our houses and stables right. Pure air is food. Bad air is poison.—Hoards Dairyman.

### FITTING HORSE COLLARS.

The principal part of a horse's harness to fit properly is the collar. Try to have it fit the neck as the shoe does the foot. If either too large or too small it is injurious and most uncomfortable. The collar that fits the horse perfectly when first put to work in the spring will be too large after working a few weeks, because horses standing idle in the barn during the winter months take on flesh which is reduced with work and activity, when spring comes. Every horse should have its own collar. Other parts of the harness can be loosened or tightened, but a collar cannot be made to fit two horses properly. The manufacturers of collars have of late years so improved the shape and material used that there is no reason why every horse is not fitted as it should be.

### QUARANTINE AGAINST ISLANDS.

The Secretary of Agricluture has issued the following order as a result of a reported outbreak of the foot and mouth disease among live stock on the Island of Jamaica, British West Indies:

All hay or straw, the product of the Island of Jamaica, British West Indies, or which has been transported through said Island, shall be disinfected as may be prescribed by the chief of the Bureau of Animal Industry, at the expense of the importer, before being unloaded from the vessel bringing it into any port of the United States, and when unloaded and landed it shall be stored and held in quarantine for a period of not less than three months in some places acceptable to the chief of the Bureau of Animal Industry and under conditions prescribed by him.

### CRACKED HOOFS.

If the colt's or horse's hoofs are cracking, do not allow them to stand in a moist stall, but keep everything dry and clean. It is standing in a wet place and then being placed in a dry pasture or on the dry road or field that causes horses' hoofs to crack. Apply one part coal tar disinfectant and six parts lard to the cracks. Vaseline and carbolic acid at the rate of one part carbolic acid to ten parts vaseline is also a good remedy. Apply daily to keep the place soft till entirely healed over.

Solano county is appealing for a good roads campaign.

### MILCH GOATS.

The raising of milch goats is comparatively a new industry in this country. They are destined to become a factor in the dairy business and will to a large extent take the place of the cows that furnish our cities and towns with milk. It might take a long time to fully develop this industry, because there are but few milch goats in this country, and to increase the number the breeders will have to do as the pioneers did with the Angora, and that is to cross the imported European milch goat bucks with the common Mexican goat. After several crosses the offspring will become profitable milch goats. As with the Angora, they should not be kept on low marshy land, and the management of these two breeds is very similar except that the milch goat should have grass pasture and be kept much as our dairy cows are kept. The feed required for one cow will feed eight milch goats and a good milch goat will give about one-half gallon of milk per day. There is a large demand for this milk from hospitals, consumptives, persons with weak stomachs and those who have babies to raise. Goat milk is much richer than the finest Jersey cow milk, and on account of the healthfulness of the animal and its practical immunity from tuberculosis, which affects cows, there is a large demand for the milk, and at present it commands a price of $1 per gallon in the cities. This milk can be produced cheaper than cow's milk and it will always command a higher price.—William J. Cohill, in American Sheep Breeder.

### COLLAR BOILS.

When horses are put into hard work in the spring, collar boils and other festering sores are liable to form on the shoulders. Such troubles are more frequent with young horses than with old ones which have been worked through the winter. The first thing necessary is absolute rest. The trouble can not be successfully treated when the horse has to work even a part of the time. Wash the sore with warm water once each day. These washings should not be too strong, just enough to remove the pus which may have formed since the former washing, but not hard enough to remove the healthy scab which may be forming. In case there is pus forming under the scab or a layer of the skin, the formation should be lanced to allow the pus to escape. This sore should be kept open and allowed to heal from the bottom. After the affected part has been washed as above suggested, put one ounce of sulphate of zinc and three drams of tannic acid in a quart of water and apply this to the sore.

### LET THE OLD COWS GO.

After a cow has outlived the period of greatest usefulness, it is best to fill her place with another, and the best way we find to get rid of her is to dispose of her from grass. If a calf is by her side, the two are usually sold together, and the time of selling is at such time as the grass fat shows to greatest advantage.—Farmers' Mail and Breeze.

---

It is planned to remove the Oregon exhibit at the Seattle Exposition to Salem for permanent exhibition at the State Fair.

### BETTER DAYS FOR MILK GOATS.

A few years ago near one of our great centers in California it was possible to obtain a milk goat of some excellence though of unknown parentage. Some of these were quite pretty and breedy-looking; some even hornless; and there were records of from three to five quarts of milk per day. But when we sought a mate for them of similar style or equal merit there was none. Perhaps some China camp kept a frightful looking animal on a strong chain with a stronger smell, out in the suburbs; and it was that or none. Or the huckster that bought chickens, ducks and goats to sell again, might have some kind of a "billy" or put you on track of one. This one probably looked like a buffalo in front, but wound up like a tom cat.

Young Grade Toggenburg Doe.

If two or three years ago there was some excuse for this state of things, there is none now. For there have been fresh importations of pedigree stock from headquarters in Switzerland; and, be it observed, these have hindquarters, too! Moreover kids have been born in California, full-blooded buck kids that should be used as widely as possible. Banish the common scrubs.

If not convenient to own a stud ourselves, perhaps we can make our dealer get one. Several of us in the old days would gladly have paid five or even ten dollars instead of the traditional fifty cents for the service, but there was nothing to be had. People have called on me from hundreds of miles away to direct them to a mate for their does when I had no good news to hand out.

The pure breds—Toggenburg, for instance, are very prepotent, and the results of a cross on selected native does are highly encouraging.

In this way a California strain of valuable dairy goats may be built up in a few years.—B. A. R. Stocker. Arroyo Grande.

### FEEDING FOR MUTTON.

Sheep must have clean water, clean feed racks and pens and sanitary surroundings if they are to make profitable gains.

The bedding should be liberal and should be changed frequently and not be allowed to become foul or damp, for sheep will not thrive unless kept absolutely dry and afforded pure air.

The foods best adapted for sheep are clover and alfalfa hay, all that will be cleaned up at a feeding; corn ensilage about four pounds to each head, or roots when ensilage is not available, and two parts each of wheat bran, oats, peas or corn, and one part oil cake, or one part wheat bran, one part corn meal and one part ground oats, supplemented with about one small handful of oil meal to each lamb.

Many feeders prefer to feed the grain whole, and generally it will produce better results, although many feeders still cling to the idea that the sheep, as well as some other farm animals, will derive more nutrition from ground grains.

The choice of the grain foods will depend to a certain extent upon what kinds of home-grown foods are available, and the rations should be made up with an eye to economy, as well as to that of producing the most rapid gains.

It is important that those who feed lambs should have proper accommodations for them.

# Small Fruits and Vegetables

## THIS MONTH.

THIS MONTH is a season of little inducement to work in the garden. The freshness of spring is gone, and the old leaves, vines and other refuse of the garden are unsightly. These should be cut, burned or piled in the compost heap for a mulch for next season. We believe, however, that it is wise not to use this compost on the garden. It is very liable to carry disease germs which might affect the same kind of crop another year, but it may be used without danger on orchard or other field crops.

After removal, the ground may be spaded, or where water is abundant it would perhaps be more profitable to plant a leguminous crop to occupy the soil and make a cover crop to turn under later. If stable manure is to be used for fertilizer, it could be plowed under and wetted down so as to get it in shape for the next season.

But it must be borne in mind that this is not a season of entire dearth of producing good things for the table. The second or fall crop of potatoes may be planted at once; also, of course, cabbage, cauliflower, celery, onions and green peas. The first sowing of tomatoes for the winter crop is made this month. If lettuce, radishes and such crops are sown at this time, extra care must be taken to keep them supplied with moisture. In fact, almost daily applications of water are necessary to give tender crops, and even then a partial shade is advisable.

## PREMIUM FOR CRIMSON WINTER

Mr. J. B. Wagner of Pasadena writes us that he is making his usual effort at the coming state fair to induce the exhibition of the finest display of crimson winter rhubarb ever made. He is supplementing the regular premium offered by the state fair management, and states:

If the reader will turn to page 98 of the premium list of the coming State Fair he will note the following premium offers on rhubarb made by me:

I will offer prizes at all state fairs for best exhibit of winter rhubarb: First prize, $50 worth of rhubarb plants; second prize, $25 worth; third prize, $10 worth. To all who compete and do not receive one of above prizes, $2.50 worth of plants will be given. This offer open to all growers of the state regardless of where they secured plants.

Now I want every grower who possibly can to enter this contest He will get enough to pay the cost of same in plants. In the past only a few lots have been exhibited and those in a miscellaneous way. The time is short to do much in the way of forcing for exhibition purposes, but very surprising and satisfactory results may be obtained by following rules given below:

Cut off all the buds carefully except a couple of the strongest, close to crown, thus forcing all the growth into a few crowns or buds. Not over one or two should be allowed to develp stems.

To stimulate it to its utmost get a large flower pot or 5-gallon oil can, having holes in sides and bottom. Place same about one or one and one-half feet from plant, bed it in the ground so that top is even with surface between hills. Fill this often with liquid manure and water of which too much cannot be used. A good substitute for liquid manure is nitrate of soda dissolved in water, using about a teaspoonful to two or three quarts of water applied every few days. The results of either process will be highly satisfactory and surprising, and will pay any one for the effort.

The planting this season has been heavy. About two hundred acres are at Pomona by a local company. Also a number have put out from five to ten acre fields. Several other large tracts have been planted, including the planting at Monrovia of 150 acres by the J. R. Loftus Company. Now is a good time to plant. I have just completed the sale of two large orders, one for 18,000 and one for 20,000 plants that are now being set out.

## GARDEN HINTS.

More depends on the proper setting of a strawberry plant or any kind of plant or tree than most people can be led to believe. If the roots to the strawberry plant are very long it is best, though not essential, to trim them back to about four inches. The holes should be opened broad and deep enough to admit of the roots being spread fan-shaped and the earth should be pressed firmly around them. The proper depth to set a plant or tree of any kind is the depth that nature set them. Observe and discover this when you dig them up.

In the garden bed strawberry plants can be set in rows fifteen inches apart, with the plants fifteen inches apart in the row. But between each series of three rows there must be left an alley or walk two feet wide. All runners must, of course, be kept closely clipped from plants set this way, and indeed from all plants grown in the stool or hill system.

Dewberry plants should be set six feet apart. A good plan is to run the rows six feet apart and then cross at right angles with rows the same distance apart. Right in the check, where the cross comes, the plant can be set, spreading out the roots well. Raspberries, blackberries and grape vines can all be set this way. Plants or vines set this way can be plowed both ways and the hoe almost entirely dispensed with in cultivating the crop.

A good way to apply manure or fertilizer to plants set this way is to drill it in the open furrow on the four sides of the plant and cover with earth. About the same manure can be used on dewberries, blackberries and grapes as on the strawberries.

## SQUASH BUGS

The suash bug is a flat insect, rusty black in color, with yellow belly. It is about a half inch long, and emits an offensive odor. It winters in the adult form underneath leaves, boards, etc., and lays its eggs on the under side of leaves in June. The young are hatched out in a short time.

To get rid of them, hand picking in the morning and evening, when the bugs are less active, is a good plan. Kerosene emulsion diluted with 12 parts water sprinkled on and about plants is recommended. Shingles or small boards put about the plants serve as hiding places for these insects, and then they can easily be killed.

All harness leather needs an occasional oiling and blacking, and

**EUREKA Harness Oil**

is best for the purpose. There is no acid quality about it and it cannot become rancid. "Eureka" penetrates deep into the leather and *stays there* to resist the rotting effects of wet and weather. Use Eureka Harness Oil.

# The Ornamental Garden

### THIS MONTH

PANSIES and stocks should be sown in well-prepared seed beds during this month. Light sandy soil is preferable, and it should be well pulverized and levelled before seeding. Cover the seed very lightly and lay burlap on top to keep soil from crusting over, and of course the ground must be kept wet. As soon as the tiny plants appear through the soil remove the burlap and give partial shade to the ground with lath or thin cloth.

The violet beds should be given attention, the old plants divided and the new stock re-planted. Mulching should be given to the older plants and the soil thoroughly worked. Of course it goes without saying that abundant moisture must be supplied this month when the lower water levels are becoming exhausted.

This is a good time to sow the hardy perennials which will be expected to bloom early next spring; cinerarias, primulas, carnations, salvia, China pinks, verbenas, and petunias may be sown. For sowing in boxes use a fine leaf mold which has been screened and mixed with sand. Seeds may be kept covered with glass until through the ground. Care must be taken to give air, and they may be hardened by partially removing the glass for several days before exposing.

Golden glow and golden rod are both about to come into bloom and will need abundance of moisture. Shasta daisies are now losing their beauty, especially if they have not been kept cut back closely. The tops may be mown to induce new growth of flower stocks. However, the best part of their season is gone, except for those that were planted late. These may be divided now if earlier bloom is wished for next spring, but the regular time for dividing them is January or March. We have found them remarkably hardy and capable of being divided and re-planted every month in the year.

The lawn now needs an abundance of moisture. If allowed to become brown it loses its vitality and, especially on slopes, begins to dry out, and trouble will begin to appear in the shape of devil grass and weeds. Perhaps we should be more polite and refer to the former pest by its proper name as Bermuda grass, but the other word expresses one's feelings more satisfoctorily. Many have entirely given their lawns over to this pest and show with some claimed satisfaction their success in making a fairly good looking lawn. Unless a blue grass lawn is given continual attention, one might just as well start with Bermuda grass, but constant raking, abundance of fertilizer and water will give the blue grass if one wants to pay the price. During the warm months, Bermuda makes a very satisfactory sward, but the first cold weather of December turns it a very unsightly brown, and though it is still a good mat, it is not attractive. If the blue grass is desired, one should rake over the lawn almost every day to cut the runners of the Bermuda, and this should be varied with the "knee drill" to uproot many of the plants. It must be remembered that the seed either fly through the air or are carried in the water, and it is a constant fight to keep them out.

Lippia is proving very satisfactory. I have planted almost every month in the year and find that it responds with alacrity to any kind of treatment. Some was planted a few days ago, abundance of water being given immediately and for several days afterward, and little runners are already starting out to cover the ground. Lippia is not to be compared with blue grass if one wishes to give it care, but on rocky hillsides or where impossible to give the care necessary for blue grass, it is very satisfactory. Those having poultry will find that it is very greatly relished, and when they are allowed to run on it a few hours every day, no lawn mower will be needed.

Rowing on Imperial Valley Canals.

### PROPAGATING THE ROSE.

The first step in the propagation of roses on their own roots is to thoroughly pulverize and enrich the soil surrounding the plant from which propagation is to be done. Then "peg down" with hair pin wire about a foot long with a mallet the lower part of the branches from which cuttings are to be taken. The effect is to start growth on these lower branches. Make cuttings with a "heel" where that can be done, and cut in the fall at the time the foliage falls from the bushes. Cut to three eyes and put cuttings into a tub of water, leaving them there for a few hours. Two of the eyes should be above the "old wood." Put the cuttings into a sandy bed which has been shaded and that is not exposed to the currents of air. After thirty days, at growing temperature, the cuttings should be rooted; then increase the air currents gradually until the plants are exposed to the outside atmosphere.

To make a good rich propagating bed, dig a good deep trench and fill with barn-yard compost from the horse stable to within nine inches and cover this with soil made of two-thirds sand and one-third rich alluvial soil, the essential point in propagating being to get the new vigorous tissues of the wood which will callous and make roots, then to keep the cuttings moist and out of draft until they are well started. In the spring set out in the propagating bed properly enriched and prepared so that rapid growth can be made during the summer to prepare the plants for the fall trade.

### THE PHLOX.

This is from "phlox"—a flame—owing to the brilliancy of its colors. This is a native of North America—a flower of our own land. It was so hardy and beautiful that it was taken to Europe in the hope of improving it. The hope was more than realized. The flower went over as a wild, untutored Indian maiden, and was returned to us as a princess arrayed in fascinating splendor.

In improving flowers, when but little removed from the parent stock, there is a tendency for plants to revert to the original type; but after long and continued effort they are so far removed that they break loose from their antecedents, going into a wild abandon and prodigality of loveliness. And we have now reached a point where before us are surprises of form and color.

### SCHOOL GARDENS.

I believe that it ought to be a part of every boy's education and of every girl's, too, to learn how to take care of vegetables, fruits and flowers. I believe, too, that the main trouble with most of the troublesome boys and girls is that they don't have enough work to do, or enough of anything worth while to interest them. They are restless and uneasy, and hunting trouble all the time. I believe that nine-tenths of the incorrigible and troublesome children can be permanently cured by having a garden of their own. I believe a few things still more radical than this along this same line, but this is enough for a start. And I believe further, that the boy who has an interest in a melon patch and a small garden all his own will be very likely to respect the property rights of others.—St. Joseph Fruit Grower.

Heavy rains fell last week in some portions of the Colorado Desert.

If apples tend to be wormy, spray with arsenicals; if the skin is rough or diseased, spray with Bordeaux mixture.

The Ceres creamery averages about 40,000 pounds per month or an average of nearly a ton per day. This creamery is a co-operative organization having over 200 members.

**Feijoa Sellowiana**

The most delicious fruit known. A charmingly beautiful flowering shrub, hardy as far north as Red Bluffs. Fine plants 75c and $1.00 each. We are specialists in rare fruiting plants. Send for list.

### A GOOD SYSTEM.

An article in a recent number of the Saturday Evening Post corrects in an interesting way a somewhat general misapprehension as to the safety of banks and of national banks in particular. In the panic of 1893 the final net loss to the depositors of the sixty-five national banks that failed that year was but $4,508,164, or a little less than one-third of one per cent of the total amount of individual deposits. More than half of the total loss occurred in four out of the sixty-five, and one-quarter of the total loss occurred in one bank, which was, of course, a striking example of rotten banking combined with rotten politics.

An honestly managed bank may perhaps be closed by a "run," but if the assets are not there to pay depositors in full, it is a safe proposition that some one has taken them unlawfully.

The year ending Oct. 31, 1908, was also a trying time for banks, thirty-three national banks going into the hands of receivers. Nine have resumed, and others have paid in full. In the final account, the relative loss will be less than in 1893. Seven of the failed banks were wrecked by their cashiers, four by fraudulent management, and six by reason of excessive and illegal loans. One only, as reported by the Comptroller of the Currency, failed on account of "the general stringency of the money market."

The conclusions drawn are favorable to our present banking system, when honest management prevails—and that prevails so generally that in the worst panic year known during the 44 years since the national bank system was organized, the actual loss to depositors was about three mills on the dollar.

### IRRIGATION.

Next Monday will witness the opening of the Irrigation Congress at Spokane, Washington. This congress in its former meetings has had to do with big things which concern the West in a way which will command for it a place in American history. What it has accomplished has not been without opposition, not only from large interests in the East but strange as it may seem, from some interests in the West as well. The organization has made its mistakes and has been used possibly by some to accomplish ends which were not for the best interests of all, but in the main it is worthy of the support of the nation, and as a general thing it has had that support. It has been rumored that there would be presented at this meeting a resolution calling upon the United States Government to bond itself for five billion dollars for various lines of development, conservation, reclamation, etc. This is rather a wild and woolly proposition, and we do not for a moment suppose that the congress will endorse anything of such magnitude.

The Cultivator proposes to touch upon points which will be of interest and will give special attention in its irrigation department to matters which will be handled by this congress which promises to be one of the greatest. We trust this will be the means of bringing before our readers a fund of information which will be of much value.

### GREEN MANURE CROPS.

One of the strongest factors in the up-building of the mechanical and even the chemical condition of the soil is the green manure crop. The Cultivator is gathering data for use in an article about the first of September. In fact, we imagine almost one whole number of the paper will be pretty well filled with facts regarding cover crops. We speak of it now that our subscribers who have had experience along this line and have determined upon procedure and the factors of successful use of the cover crops, may send in to us such information as they have. This will be appreciated by every reader of the Cultivator who is gathering points from the experience of others. The use of the green manure crop is increasing every year, and we believe that the more its increase can be encouraged, the greater will be the profit to the orchardist.

### EDUCATING TEACHERS IN AGRICULTURE

The State University of Maine has established a course in agriculture for teachers. It is open to college graduates, to high school teachers who have had at least two year's experience, and to normal school graduates who have had three years experience in teaching. The Minnesota State University is also contemplating a similar course. This is beginning at the right end of the problem, for until qualified teachers can be had for these courses, the work should not be taken up in our public schools. It surely is a pitiful sight to see a teacher attempting to educate her pupils in subjects of which she has no practical knowledge herself.

### DUE CREDIT.

There is at the present time in California a representative of the Bureau of Plant Industry who is making a study of varieties of cacti and of desert conditions, with a view to determining the worth of cactus and its adaptability to conditions on land which will probably always be under desert conditions. This gentleman is Mr. Chas. Henry Thompson who is connected with the Missouri Botanical Gardens, but at present working under direction of the Bureau of Plant Industry. Mr. Thompson said that the city park of Riverside had one of the finest collections of cacti in the world and the most complete assortment of specimens of native American varieties.

Referring to spineless cactus, and especially to Luther Burbank and his connection with it, Mr. Thompson said:

"Mr. Burbank is perhaps overrated. He has become conspicuous because of newspaper boosting. The yellow journals have accomplished more in print than he has done in science. Do not misunderstand me to decry Mr. Burbank's worth. But the spineles cactus existed many years prior to his investigations and experiments. He has been shrewd in the selection of his experiments and his ability to produce freak specimens in nature, but his work is not so much of universal benefit as it is of value to California alone. The fruits, for example, which he has perfected are not of such varieties as will benefit the east, with the exception of his sugar prune. Mr. Burbank has not solicited notoriety, but newspapers have written so much of him, and he has been termed 'wizard' so often that the public has come to regard him as a plant prestidigitator."

The above is, we believe, a most just estimate of Mr. Burbank's work in California. If a true estimate could be placed upon his work we feel that more good would be accomplished than ever can be by the yellow-press-advance-agent style of treating it. As Mr. Thompson says, we do not believe that Mr. Burbank has ever sought for notoriety, but by a combination of circumstances the yellow press has taken him up in such a way that an exaggerated estimate has been placed upon results attained by him, until the careful observer has been nauseated.

The only good which we can see in such publicity is that attention has been attracted to the advantages of seed selection and plant betterment so that orchardists have more fully realized it. Let not jealousy take from anyone the fullest credit for good work done. Let every credit be given, but let us not be so anxious to give credit that a condition bordering on hysteria is created and the close observer turned away and prevented from giving real credit due.

---

If there is one enterprise on earth that a "quitter" should leave severely alone, it is advertising. To make a success of advertising, one must be prepared to stick like a barnacle on a boat's bottom. He should know before he begins it that he must spend money—lots of it. Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game. Advertising does not jerk; it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year until it exerts an irresistible power.—John Wanamaker.

---

"The salt of life is work," according to some wise man. But there are some people who do not like too much salt.

## Shop Talk

**SAMPLE COPIES.**—This is to suggest to the readers of the Cultivator that upon request we will gladly mail, free of charge, sample copies of our paper. It often happens that an article published might be of special value to a neighbor or relative, and which would be appreciated by them. We will gladly mail such back numbers when asked for if enough remain on hand.

In this connection too, we want to mention that we can now make an inducement to send in new subscriptions and if in ordering samples sent, mention is made that you hope to interest some new subscribers, we will send order blanks and full particulars by return mail.

There are many new comers and others to whom the Cultivator would be of great value and whose attention has never been called to it. By taking advantage of our offer, subscribers will be doing these people a favor and at the same time reap a benefit for themselves and their favorite paper. Send along a list of names and we will do the rest.

---

**CHANGE OF ADDRESS.**—When it is desired that the address on the Cultivator be changed, subscribers will please bear in mind that we must have the old address as well as the new. Our list is large and indexed according to postoffice, so it is necessary to give this information in full.

# Agricultural Notes of the Pacific Coast

## Northern California

Yolo county boasts of corn twelve feet high.

Cottonwood, Shasta county, is shipping a carload of fruit daily.

Sonoma county will raise about 20,000 bales of hops this year.

Work began last week in the Armsby packing plant at Yuba City.

Orland, Glenn county, reports the alfalfa fields as seriously affected with dodder.

Yuba City has shipped ten carloads of pears under refrigeration to the London market

Several filings for irrigation rights have been made along Putah Creek in western Yolo county.

Some of last year's hold over dried fruit in storage in Yuba City is now being packed and sent to market.

It looks a little like carrying coals to Newcastle, but Sebastopol reports shipping a carload of apples to Oregon.

A large reservoir is to be constructed in Lake county to store water for irrigating in Winters and Davis, Yolo County.

Arrangements are about completed for the big live stock show and race meet to be held in Woodland, Yolo county, August 18 to 21.

Red Bluff reports grain warehouses almost empty, most of the grain which is unthreshed having been picked up by anxious buyers.

Santa Rosa Grange Patrons of Husbandry at its recent meeting discussed the pure food law and commended the department for its rigid enforcement.

At the recent Anti-Dredgers Convention held in Sacramento a committee of six was appointed to investigate the operations of gold dredgers in this state.

Wheatland reports the contracting for a number of crops of hops at satisfactory prices, and a general condition of the market which promises good returns to all hop people.

Pears have brought from $300 to $400 per car more than was obtained last year. This is thought to be in part due to the fact that they were much earlier this year than usual.

The State Engineer is having surveys made through Moon Bend below Colusa for the purpose of determining the cost and practicability of cutting a channel. It is estimated the cost will be about $25,000.

Los Angeles capitalists who are investigating the advisability of establishing a beet sugar factory in Yolo county demand a good sized bonus of the producers of that section as an inducement for the building of a factory. It is rumored that Yolo county people will refuse the offer.

The fruit situation at Vacaville and other points has been very serious because of shortage of refrigerator cars. One large shipper is reported as having said that the car service this year will probably involve the loss of large sums of money. The shippers are generally prepared to hold the railroads responsible. Vacaville recently had two cars in hand for shipping, with frult on hand which would have filled many times that number.

## Central California

Corcoran beets are running about 22 per cent saccharine content.

Modesto boasts of about 230,000 acres of alfalfa surrounding it.

Hanford claims to have more than 500 dairymen in its immediate vicinity.

The Selma Cannery will have an output this year of over 50,000 cases of peaches.

The Chamberlin Canning Company at Bakersfield put up 25 tons of apricots this season.

The management of the Tulare county fair is making preparations for a bigger fair than ever.

The farmers' union is shipping largely of watermelons from Turlock, which has an immense acreage.

One Turlock watermelon grower has sold his melons from twenty-five acres for the lump sum of $2,000.

Corcoran creamery is shipping about a 100 gallons of sweet cream, pasteurized, to Los Angeles, daily.

The heavy drop of bellefleurs in the Pajaro Valley has reduced what was at first thought to be a record crop.

The Modesto grange reports that more gypsum is sold around Modesto, Ceres and Turlock than all fertilizers combined.

Lindsay estimates a shipment of 25 cars fresh grapes this season, with some of the first shipments now ready to go.

The Lucerne creamery has moved into its new quarters in Hanford. One day's churning recently aggregated 8500 pounds.

Farmers at Turlock have pooled their issues in the marketing of the watermelon crop which was sold to the farmers' union.

The people of Corcoran are planning for a Sugar Day in which sugar will be dispensed and a reception held at the big sugar factory.

Turlock is now forwarding a superior grade of cantaloupes largely to the Northwest. The crop will not be quite so large as usual.

The Modesto grange is buying heavily of red oats, the only variety produced in that section. The general price is in the neighborhood of two dollars.

The Watsonville Cold Storage Company has filed articles of incorporation, the first directors being: E. A. Hall, J. E. Trafton, O. D. Stoesser, W. J. McGrath, A. W Cox, J. H. Thompson, J. D. Murphy, J. J. Morey, J. B. Holohan and H. S. Farnsworth.

Reedley is boasting of a gigantic zanzibarensis, or one of the castor beans, which was planted on the 12th of May and measured on the 23d of July eleven feet and ten inches. It is on the ranch of Geo. S. Baker, a short distance south of Reedley. This variety is one of the most ornamental of the castors.

The Modesto Canning Company has closed its recent campaign on apricots of which it made a big pack of exceptionally fine fruit. It is reported that owing to lack of capital the cannery may close for the rest of the season. The growers are hoping, however, that peaches and tomatoes may yet be handled.

## Southern California

Grape crushing began about the first at the big Cucamonga winery.

Imperial Valley hog growers are now receiving six cents f. o. b. local points.

The mountain valleys back of Redlands report an excellent crop of hay and grain.

Squirrels are doing immense damage to the grain fields of the San Marcos Valley, San Diego county.

In the lands of the Italian Vineyard Company at Cucamonga there are over forty varieties of European grapes.

The "California Grown Imported Date Ranch Company" has filed articles of incorporation in San Bernardino county.

It is reported that Santa Barbara and Ventura counties will produce about 250 carloads of dried apricots this season.

Freestone peaches seem to be selling rather low, the price quoted being from $13 to $15. Some clings have sold as high as $20.

Pomona Cannery put up about 300,000 cans of apricots and is now working on peaches. About a million cans is expected to be the output.

Canners and dryers in the town of Ventura handled over 600 tons of green apricots this season. The largest one day's run was fifty tons.

The pioneers opening up the Palo Verde country in Eastern Riverside county, had a hard fight with the waters of the Colorado during its flood.

The first car of Imperial Valley grapes to be shipped to Chicago is being watched with interest and at present one car per day is being forwarded.

The Southern California Sugar Company at Santa Ana started with a force of about 150 men and find the big new plant very satisfactory in its work.

The acreage of lima beans in Ventura county is about the same as last year, but it is thought the output will be about 700,000 bags as against 900,000 last year.

The item in last week's issue that German buyers are willing to pay ten cents a pound for Imperial Valley honey should have stated that this price was f. o. b. German points.

Orchardists near Colton have begun action against the big cement works near that town because of the dust lodging on leaves of orange trees proving detrimental to best growth.

The directors for the Ventura County Bean Growers' Association are: Chas. Donlon, G. C. Power, C. J. Daily, F. A. Snyder, Roger Edwards, A. Camarillo, T. G. Gabbert, D. F. Sheldon, C. L. Chrisman, H. K. Snow, Jr., and J. D. McGrath.

The new board of directors elected for the Imperial- Coachella Valley farmers association are: L. W. Ott, Holtville; F. L. Stahl, Brawley; A. L. Storie, Imperial; Fred Fuller, Heber; Wilbur Clark, Silsbee; I. Mayfield, El Centro. A director from the Calexico district will be elected soon. From the Coachella district, L. G. Abbott, of Coachella, and George Beach of Thermal, have thus far been named as directors.

## The Coast

Sixty cars of cantaloupes were shipped from Glendale, Arizona, this season.

Potato growers at Leland, Idaho, report the appearance of the Colorado potato beetle

The Hawaiian Sisal Company ships fifty bales of sisal to San Francisco every month.

The first annual cherry fair and festival recently closed at Gresham, Oregon, was a complete success.

Reclamation engineers are to meet in Portland, Oregon, with the Secretary of the Interior on August 15th.

The drawing of public land near Spokane has attracted immense crowds, over 300,000 applying for filing.

The Oregon hop crop is estimated at 65,000 bales. The quality will be good though not so heavy as last year.

There is a new railway in contemplation from Globe to Phoenix, Arizona which will open up some good agricultural land.

The local farmers' union at Waitsburg, Washington, will build large warehouses on the O. R. & N. at Menoken and Alto.

The acreage of oats in Washington is increased twenty per cent over that of last year, while the output will be nearly double.

Owing to large number of new machines introduced into Idaho this year the threshing season will be much shorter than heretofore.

Following heavy rains near Helena, Mont., the loco weed made very heavy growth which resulted in poisoning many sheep, 500 from one band being noted.

The Clydesdale is the principal draft horse of Canada, a recent canvass of the Province of Ontario showing 80,000 as against 18,000 Percherons, and 1,500 Belgians.

Portland reports that the city is practically undergoing a hay famine. Some high-grade timothy is selling at $30, and the lower grades of grain hay are commanding as high as $20.

The water users of District No. 2 near Yuma recently held a mass meeting to discuss questions submitted by the Congressional Committee which will visit Arizona in October.

Hawaiian Islands have a nursery conducted by the government, which is producing immense numbers of ironwoods, eucalypts, and other forest trees for free distribution in the various islands.

Governor Freer of the Hawaiian Islands has signed proclamations creating four new forest reserves in the territory, whereby 83,243 acres of government land are set apart for forest purposes.

Poultry people of Whitman county, Washington, have just organized the Whitman County Poultry and Pet Stock Association. Plans are being made for the holding of a show in Colfax in January.

Farmers at Pendleton, Oregon, under the corporate name of the Farmers Railroad and Navigation Company, are building an electric railway which will handle the products of their farms more satisfactorily.

The California Seed Growers Co., at Westminster is now shipping large quantities of onion sets.

Lack of warm weather has seriously affected the yield of honey in Yakima county, Washington.

# Profit in the Poultry Yard

By Mrs. Frank Metcalf

**We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.**

## HOW TO KEEP POULTRY FREE FROM LICE.

ONE of the most difficult and trying problems which the poultry keeper has to meet is that of keeping his poultry houses and stock reasonably free from lice, mites and other external parasites. There are many proprietary preparations on the market designed to accomplish this end in one way or another. Most of these preparations are, in proportion to their efficiency, very expensive. Many of them have been tried at the Maine Experiment Station. The Station has finally, however, come to follow the procedure outlined to the exclusion of all others, and with results which are extremely satisfactory. Indeed, it may be said that vermin on the poultry or in the houses no longer cause any appreciable annoyance in the work of the station plant.

In keeping a poultry plant free from lice there are two points of attack: One, the birds themselves; the other, the houses, nest boxes, roosting boards, etc. For the birds themselves experience has shown that the best way to get rid of the lice is by the use of a dusting powder to be worked into the feathers. In using any kind of lice powder on poultry, whether the one described in this circular or some other, it should always be remembered that a single application of powder is not sufficient When there are lice present on a bird there are always unhatched eggs of lice ("nits") present too. The proper procedure is to follow up a first application of powder with a second at an interval of four days to a week. If the birds are badly infested at the beginning it may be necessary to make still a third application. To clean the cracks and crevices of the woodwork of houses and nests of lice and vermin a liquid spray or paint is probably the most desirable form of application.

The lice powder which the Station uses is made at a cost of only a few cents a pound in the following way:—

Take 3 parts of gasoline, 1 part of crude carbolic acid. Mix these together and add gradually with stirring, enough plaster of Paris to take up all the moisture. The liquid and the dry plaster should be thoroughly mixed and stirred so that the liquid will be uniformly distributed through the mass of plaster. When enough plaster has been added the resulting mixture should be a dry, pinkish brown powder having a fairly strong carbolic odor and a rather less pronounced gasoline odor.

Do not use more plaster in mixing than is necessary to blot up the liquid. This powder is to be worked into the feathers of the birds affected with vermin. The bulk of the application should be in the fluff around the vent and on the ventral side of the body and in the fluff under the wings. Its efficiency, which is greater than that of any other lice powder known to the writer, can be very easily demonstrated by anyone to his own satisfaction. Take a bird that is covered with lice and apply the powder in the manner just described. After a lapse of about a minute, shake the bird, loosening its feathers with the fingers at the same time, over a clean piece of paper. Dead and dying lice will drop on the paper in great numbers. Anyone who will try this experiment will have no further doubt of the wonderful efficiency and value of this powder.

For a spray or paint to be applied to roosting boards, nest boxes or walls and floor of the hen houses the following preparation is used:—3 parts of kerosene and 1 part crude carbolic acid. This is stirred up when used and may be applied with any of the hand spray pumps or with a brush.

In both of these formulae it is highly important that crude carbolic acid be used instead of the purified product. Be sure and insist to the druggist on getting crude carbolic acid. It is a dark brown, dirty looking liquid and its value depends on the fact that it contains tar oil and tar bases in addition to the pure phenol (carbolic acid.)

The routine method which the Station uses in handling its stock with reference to the lice problem is as follows:—

All hatching and rearing of chickens is done in incubators and brooders. The growing chickens are never allowed to come into any contact whatever with old hens. Therefore, when the pullets are ready to go into the laying houses in the fall they are free from lice. Sometime in the late summer, usually in August or early in September, the laying houses are given a thorough cleaning. They are first scraped, scoured and washed out with water thrown on the walls and floor with as much pressure as possible from a hose. They are then given two thorough sprayings, with an interval of several days intervening, with a solution of creosol. Then the roosting boards, nests, floors and walls to a height of about five feet are thoroughly sprayed with the lice paint (kerosene oil and crude carbolic acid described above.) Finally, any yearling, or older birds, whether male or female, which are to be kept over the next year's work are given two or three successive dustings, at intervals of several days to a week between each application, with the lice powder described above, before they are put into the cleaned houses.

---

It will pay every owner of a flock of poultry to sit down and figure out what can be done to lessen the amount of labor required daily. One will be surprised to find out how many useless steps are taken in the care of poultry on most places.

---

Regulate the number of hens to the size of the yard and house. Don't keep too many, but keep good ones, and then give them good care. That is the secret of success in poultry raising.

---

Don't keep poultry. Make them keep themselves and a good profit for you.

### THE USE OF CREOLIUM.

Creolium is a comparatively new disinfectant and germicide, for medical, surgical and general domestic use. It is said to be ten times more potent than any remedial agent known to medical science. All germ diseases work destruction through a process of fermentation embracing acid conditions, favoring the formation of germ life. Any germicide that would destroy all germ life, would also destroy the white blood cells, which are living organisms necessary to animal and human life, being builders and scavengers of the body.

Creolium destroys only those known as disease germs, by destroying the conditions necessary for their existence, and at the same time sets up a condition favorable for the existence of the white blood cells, neutralizing the virus of the bad germs.

As a disinfectant, the fumes of creolium are claimed to be ten times more potent than any other compound known to chemistry. It is a dark brown liquid, forming a milk white emulsion with water, with a not unpleasant odor. Its uses are manifold and I will append a few of them, thus proving that it is a "handy article to have around."

For uric acid. This is the product of a germ. When it crystalizes and clogs the small membranes of the extremities it is called gout. When the bones and muscles are involved it is called rheumatism, and when the lungs and bronchial tubes are affected it is called asthma. Creolium administered in doses of from 5 to 10 drops daily, at meal time, dissolves and destroys these harmful crystals and germs. For Catarrh either spray the nasal passages, or inject into the bladder as the case may be, one-half teaspoonful of Creolium to a glass of warm water which will bring prompt relief. For Typhoid in man, or hog, or cholera in animals,-which are almost identical, Creolium in 5 to 10 drop doses should be given every four hours, until the disease is under control. For swine plague, anthrax, etc., the dose may be one ounce, with the addition of inoculating it under the skin to reach the circulation quicker.

For dandruff, rub one ounce of undiluted Creolium into the scalp, allowing it to remain an hour, then wash off with lukewarm water, and the worst case of dandruff will yield to one treatment. Baldness is treated the same way, rubbing the scalp briskly every day for 15 to 20 minutes, and a new crop of hair will follow unless the gland at the root of the hair follicle is entirely destroyed.

For snake and insect bites, use pure and undiluted as an application and in desperate cases take inwardly, and inoculate under the skin as well. For diseases of the bone, necrosis, lumpy jaw, etc., creolium is the best known specific. For wounds, cuts and ulcers, cancerous growths, and old sores, Creolium should be applied freely, full strength, washing it off after a few hours, causing prompt healing where all other remedies have failed. For reducing inflammation, use one part Creolium to 100 parts water, saturate a cloth and apply freely.

As an antiseptic, disinfectant and deodorizer, scrubbing floors, urinals and slop pails, use Creolium one part to water 100 parts. For lice and vermin, Creolium used in the proportion of one part Creolium to 50 parts wter, will destroy all and any kind of lice and vermin on horses, cattle, sheep, swine and poultry, or bedbugs and other vermin that infest a dwelling.

If rubbed upon the hair of animals, it will keep flies away in the proportion of one part Creolium to 100 parts water. For worms and intestinal parasites, give doses of from 5 to 10 drops for human and one-half to one ounce for animals. For diarrhoea in man or beast, Creolium has no equal in doses as above. For flatulent colic it is likewise effectual. For skin diseases, mange, itch, scabs, it may be used pure or diluted with 25 parts of very hot water.

It is in the poultry yard where Creolium shines the brightest however, as it kills lice and mites, in solution with 50 parts water, thus making a cheap spray, or dip for the birds and houses, and the yards may also be sprinkled with a solution of one part Creolium to 100 parts water. For cholera, use one part Creolium to 200 parts water for drinking purposes, and for roup and swell head bathe with one part Creolium with 25 parts water, warm; dry thoroughly, then apply a salve made of one teaspoonful Creolium, one teaspoon sulphur and one tablespoonful vaseline, repeating twice a day.

For the dip for lice on poultry use one part Creolium to 50 parts water, and plunge heads and all under, rubbing it well through the feathers.

For plants, spray with one part Creolium to 100 parts water for green fly, potato bugs, cabbage worms, etc. No poultry plant is complete without a supply of this excellent cheap and handy article.—Mrs. Frank Metcalf.

---

We know of nothing better on which to scatter soft or moistened food for the young chicks than a smooth, clean board, laid on the ground. It is much better than a trough, is easier to keep clean and is easily supplied. It should be scalded every day or two and set in the sun to dry. When not in use, it should be kept in a clean place.

---

It is far better to dispose of young stock early in the season, when one can obtain 25 or 30 cents per pound and when the chick weighs about 2½ pounds, than to sell in the fall at six or seven cents per pound, when the fowl weighs five or six pounds after feeding all this time.

---

Labor is not capital. We all know how much more zest we put into our work when we see a good prospect of success. Let us remember that labor may be mental as well as physical. We must have some aptness for the business.

---

When a hen doesn't respond properly to good feeding and good care, it is a pretty good sign that she isn't "cut out" for profit in the poultry yard.

**No Flies at MILKING TIME!**

Don't blame the cow for switching her tail so furiously. Don't throw the milk-stool at her because she "side-steps" and upsets milk pail. The critter can't help it when flies are constantly prodding her hide for warm red blood.

**Conkey's Fly Knocker Knocks Flies**

Spray your cows with Conkey's Fly knocker and the flies won't come near. It drives them away. The greatest discovery of the age. Sold under a positive guarantee. Prices—qt. 35c; ½ gal. 60c; gal. $1. Agents wanted everywhere. Write today.

# DIP YOUR HENS

**When? - - - - - - Now**

Molting time is the best time in the entire year to dip your fowls.

Kill all the lice and vermin and let Biddy start in the new year in a good healthy condition in her new coat.

**In What? -- Creolium**

CREOLIUM is a coal tar preparation and and is the greatest germ destroyer and disinfectant known to the poultryman of the present day.

It is Anti-Toxin and Non-Poisonous.

The PACIFIC POULTRY COMPANY has used CREOLIUM and nothing else for years as a spray for the houses and a dip for the fowls, to keep their thousands of birds clean and healthy. What more testimonial or guarantee could you ask?

It is not expensive for in nearly every instance it is diluted to one part CREOLIUM to 50 parts water, sometimes even more.

It is an indispensable remedy for the stable and among the cattle

PRICES AS FOLLOWS:

Quarts, $1.00 — Gallons $2.50
½ Gallon, $1.50 — 5 Gallons $12.00
Special rates on large quantities.

# No 3 Condition Powders for Poultry?

A first-class tonic and conditioner like ***Coulson's No. 3 Condition Powder*** is of great benefit to the chickens, especially when used at this time of year.

***Coulson's No. 3 Condition Powders*** will prevent diseases, by keeping the flock in a thoroughly healthy condition. By the same means it will keep them laying longer into the molt, and their healthy condition will enable them to molt quickly and commence laying at an early date. As it contains no injurious stimulant, it can be used with perfect safety at all times and for this reason is fed in large quantities by numerous poultrymen.

**It Contains No Cheap Filler**

In buying a bucket or sack, therefore, every pound is of value to the chickens, and will give you large returns for the money invested.

For sale by all dealers or at factory.

# Irrigation and Forestry

### STATE CONSERVATION COMMISSION.

THE Oakland Enquirer indulges in the following rather drastic criticism of the inactivity of the California conservation commission:

Almost everybody in this State is or ought to be interested in the national movement to save the forests and preserve the waterways. Every Californian who is patriotic enough to wish to see California contlnue to be prosperous is willing to see our pines and redwoods, our rivers and streams so conserved that they will serve future generations as well as they are serving us. Your children and their children ought to have a legacy of natural resources left to them just as certainly as they will have a legacy of money and other property. Many of us, in fact, have no other legacy than the forests and streams—the property of all the people—to leave to our children. "Silver and gold have I none to leave to my children" too many Californians must confess. But even the most poverty-stricken citizen of the golden state has a citizen's proprietary interest in the trees and the water upon the existence of which our state's present prosperity so greatly depends and upon the conservation of which her future so absolutely hangs. It is not alone the lumber and timber that our forests supply that makes them necessary to us and will make them necessary to the Californians of the future. This state needs now, and will need much more in the future, water for irrigation and the development of light, heat and power. If the forests that lie at the head waters of our streams are not conserved, those streams will be torrents for three or four months in the year and waterless the remaining months.

At the present rate at which those forests are disappearing, fifty years from now there will be no California forests. Your children will have "hard sledding" to get a living in California then, because you and the rest of us apparently haven't sense enough to arrange things so that our common property, the natural resources of California, shall not be taken from us and kept from being bequeathed to our children. You remember, of course, the conference of governors, which, in response to the invitation of former President Roosevelt, met last year in the White House at Washington to consider ways and means for the conservation of the country. There were something like forty governors present at that conference. Most of the governors who were there went home and appointed state conservation commissions to work in harmony with the National Conservation Commission, also appointed by Roosevelt, and do what they could to save the forests, streams and other natural resources of the country from destructlon and annihilation. Governor Gillett has appointed such a commission for California. But, up to date, it has been conspicuous by its silence and its "innocuous desuetude." In fact, the commission has not, so far as anybody appears to know, ever had a meeting—and, in the meantlme, the forests of California are being cut, slashed and burned just as prodigally as ever, and even the heritage of your children is rapidly disappearing.

The membership of this commission as originally named was as follows: R. A. Briggs of San Francisco, president of the state board of trade, chairman; F. H. Short of Fresno; Assemblyman Grove L. Johnson of Sacramento; Mrs. Lovell White of San Francisco; W. E. Smythe of San Diego; Francis Cuttle of Riverside; F. Q. Storey, president of the Fruit Exchange, and J. C. Needham, member of congress from the sixth district.

That seems like a pretty good commission, but it is a fact, as the Enquirer charges, that the body has never had a single meeting. We would, however, ask our Oakland contemporary to refrain from including the Riverside member of the commission, Francis Cuttle, in its criticisms of lnactivity. Mr. Cuttle is chairman of that pioneer conservation organization, the Tri-counties Reforestation committee, and is accustomed to doing things. He tried several times to stir the state commission up to some sort of display of life and activity, and failing in this, he sent in his resignation to Governor Gillett. In his letter to the governor he said that he did not care to hold membership in an organization that existed in name only when there seemed to be a large opportunity for usefulness if it would "get busy."

So far as we know no appointment has yet been made in place of Mr. Cuttle, but Riverside washes her hands of the whole matter and asks to be excused when the newspapers take occasion to find fault.—Riverside Press.

### FOREST PROTECTS WATERSHEDS.

From the report of the Inland Waterways Commission we take the following regarding the value of reforesting:

"The area of National forests protecting the Sacramento Rlver watersheds amounts to 5,567,094 acres, and that protecting the Sacramento River basin to 5.023,014 acres. A very largé portion, probably 50 per cent, of this forest, as well as of other forests on their headwaters has been opened by repeated fires, and the naturally poor humus has been destroyed or further depleted. The accumulation of a good humus in these forests is imperative and the extension of the protective cover, either of dense chaparral or of forest, over the foothlll land is advisable. Reforesting these watersheds not only reduces the severity of the floods to which these mountain torrents are subject, but frequently converts a stream with intermittent flow into a perennial one or greatly augments the dry-season flow of those subject to the violent fluctuations.

"There is urgent necessity also for planting the banks of small streams to lessen the coustant erosion which is taking place."

The Commlssion quotes some freight rates from San Francisco to Inland California points, with water transportation. These are somewhat meager, although quite complete for such points as Sacramento, Stockton, and Napa. The rate per 100 pounds of freight of the first class from San Francisco to Sacramento by rail for the distance of ninety miles is quoted at 26 cents per 100 pounds as against 22 cents per 100 pounds by water. Figures on other classes of freight are also quoted to show the influence of water communication upon the rates that Sacramento has to pay.

The Commission emphasizes its view that "the capacity of these waters not only for navigation, but for other uses renders imperative the necessity for their control and utilization as an asset of almost unlimited value."

And the Commission, speaking of a class of rivers of which the Sacramento is one, declares that they "should be further investigated with a view to the systematic development of interstate commerce in coordination with all other uses of waters and benefits to be derived from them."

# General Agriculture

## INOCULATING ALFALFA SOILS

A NUMBER of the experiment stations are still trying to ascertain what the organisms, found on the roots of alfalfa have to do with the health and thrift of the plant. The New York Station has been carrying on extensive experiments in co-operation with farmers, and the result of these experiments may be thus summarized:

"In nearly every case where inoculation was tested, the roots of plants on both check plats and inoculated plats were carefully examined for the nodules associated with nitrogen-gathering bacteria. Surprising to say, such nodules were found on some plants on 95 per cent of the check plats, indicating a much more general distribution of the bacteria than was supposed. The source of these scattered bacteria is unknown—possibly they were introduced on the alfalfa seed, though previous experiments of the station, indicate that this is improbable; more likely these scattered germs have been associated with other legumes and have developed an adaptability to alfalfa. Their presence helps to explain the many cases of success following second or third attempts to grow alfalfa on the same soil. Bacteria multiply with great rapidity under favorable conditions, so that the few naturally present may in a season or two increase sufficiently to inoculate well a new alfalfa crop following one or more sowings with only scattered thrifty plants.

But on the check plats the number of plants naturally inoculated was rarely great enough to insure a good crop of hay. Of one hundred and three such un-inoculated plats, only twenty-five bore, the second year, crops which satisfied their owners; that is, crops that gave fair returns as compared with other crops on the same farms. The crop was a failure on seventy-eight plats, or more than three-fourths of all. On plats adjoining these checks, inoculated by working into the soil from 200 to 300 pounds to the acre of soil from the station alfalfa field, sixty-six crops were counted successes and only thirty-seven failures. In other words, on soils where less than one-fourth of the crops succeeded without inoculation, nearly two-thirds of them did so when provided with the proper bacteria in sufficient numbers, a gain from inoculation of more than 40 per cent in the chance for success with alfalfa.

While we have never been very enthusiastic over the practice of adding an inoculated soil to alfalfa fields, yet these results would seem to indicate that there is some virtue in the practice. This we do know, however, that if a soil is congenial to begin with an application of farm yard manure will do more to contribute to a thrifty growth of alfalfa than sprinkling over the surface 200 or 300 pounds of inoculated soil without adding manure. This has been tried over and over again, and it has been found in nearly every instance to do the work.

One of the best fields of alfalfa that has ever passed under our observation is now growing on the farm of W. H. Curtice, near Independence, Mo. Alfalfa had never been grown on this land and it would seem as though the method employed in preparing the soil had in this case everything to do with getting a stand. Stubble land in this case was plowed in the fall after applying a good coating of farm yard manure. In the spring it was thoroughly cultivated and a crop of millet sown. The millet was harvested early in August and another dressing of farm yard manure followed. This was worked in by surface-cutting implements such as the spring tooth harrow and the disk. Bear in mind that the soil was not plowed after the millet crop was removed, the theory of Mr. Curtice being that this would only bring to the surface weed seeds that would later interfere with the alfalfa. After bringing about the conditions of an ideal seed bed by surface tillage, the alfalfa was sown in the fore part of September, with the result that it is an ideal stand. If conditions are at all favorable in 1909 this alfalfa will unquestionably yield anywhere from seven to ten tons per acre. It should be said that there was not visible at the time of cutting the first crop this year a solitary weed. It should also be said that thick seeding was practiced in this case, 36 pounds of seed being used per acre.

While we are glad to give in condensed form the results of experiments conducted by the New York Station, yet we have given the experience on the farm of Mr. Curtice in order to indicate what can be accomplished by sensible cultivation combined with the judicious application of farm yard manure.—Des Moines Homestead.

# Queries and Replies

**Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### Weevils in Beans.

How may I keep weevils from getting into my beans? Do they come in the blossoms or after the bean matures?—J. W. F., Gardena.

The egg of the beetle which is the parent of the weevil is deposited on, or sometimes inserted into, the pod of the growing bean, or possibly in the pod after it is partly open; also the egg may be deposited on the dried beans after they have been harvested. The egg hatches in from five to twenty-five days according to the weather, when the young burrows into the beans and there undergoes its transformation, emerging later as a mature bettle. This stage of the insect's life may last from ten to forty days. Unless controlled, the weevil may become sufficiently numerous to ruin the crop, either in the field or in the bin after harvesting. There is no satisfactory method of handling it in the field; it must be destroyed in the warehouse or bin. The method of destroying is to place carbon bisulphide over the bins in an open dish, and the room or bin should be tightly closed so as to confine the fumes over night. Care must be used not to approach the place with a light as an explosion may result

### Moist Pasture.

Will it injure horses to stand on moist pasture? Some of it is covered with water so that the stock must wade in it.—G. E. C., Dinuba.

If the water is stagnant or heavily impregnated with alkali it is not good for animals to stand in it. We have clear creek water in many of our pastures that the stock enjoy being in greatly. There is danger of water carrying diseases. We lost a number of hogs last winter from infectious pneumonia carried by dead hogs being thrown into the creek.—M. E. S.

### Dodder.

I enclose alfalfa stem with parasite growing on it. I have cut the alfalfa close to the ground and stripped the stubble of what little of the parasite remained. Please give name and means of treatment.—A. H., Lankershim.

The parasite which you send is nothing more nor less than the common dodder (cuscuta epithymum). It is also sometimes called love vine or wishing hair. You made a mistake in cutting and carrying away the infested alfalfa. It should have been burnt on the ground where it grew. The seed is very similar to the alfalfa but much smaller and requires proper soil conditions to start it. After this first growth, however, it attaches itself to the host plant, which may be alfalfa, or in the mountains the under brush. It then proceeds to take its nourishment from the host and blooms and ripens its seed. These drop to the ground and repeat the life cycle

The only sure way of keeping alfalfa fields free from it is first; to use great caution in securing seed at planting time; second to see that the irrigation water is not contaminated with the seed. If it succeeds in gaining a foothold, we would suggest the infested spot be covered with straw and burned so that you entirely destroy it. This will probably kill the alfalfa on that spot but if clean seed is used for re-planting the spot, it is better to do that than to permit the dodder to spread.

### Pruning Eucalypts.

I have 100 small gum trees planted last spring set five by ten feet apart. Should I prune off the lower limbs, and should I stake? I also have peach trees two years old. Should I prune off the lower hanging limbs?—G. E. C., Dinuba, Cal.

No. Do not cut the limbs from young eucalypts as they become top-heavy when treated in this way. They will drop these limbs as fast as they do not need them. Cutting makes a dead place in the trunk of the tree, while if the growing inner bark pinches them off naturally, the wood tissue is not exposed to the air. If the trees have already been trimmed and are in straight lines, they may be held up cheaply by using six foot stakes at end of rows and stretching two wires, one three feet from the ground and the other at the top of the stakes and then tying the trees to them. I should leave the limbs that are of any size on the peach trees until after the heat of summer is over. It will not hurt to cut off the ends to check further growth. The danger of sunburn is great on the peach and it brings with it the borers that work in the dead tissue of the trees. It will do no harm now to have the limbs on the ground unless it opens the head so much that the trunks are burning. In this case the trunks should be protected with wrappers to keep off the sun The only limbs at the ground that should be removed are suckers from the root and these must be taken off as fast as they appear or they weaken the sap rising to the bud of the variety that is in bearing. Next season prune the trees enough to stiffen them up, and if the growth has been excessive and weak they should be more heavily pruned than if it had been stronger.—M. E. S.

### Popcorn.

Please tell me how popcorn may be harvested and cured. Should it dry on the stalks? I want to use stalks for fodder.—Subscriber, Pasadena.

Popcorn should be handled in the same way as other corn. It should be thoroughly ripened before it is harvested and stacked up in shocks to cure before husking it. After husking, it may be stored in a well ventilated place, protected, of course, from mice and other vermin. The stalks make good fodder.

### Pests Of Alfalfa.

I send in other package the following insect specimens:

1. Bee-like insect appearing in our alfalfa fields. Early in the morning thousands of them flit about over the alfalfa. They burrow in the gound and seem to subslst on locusts. Do you think them detrimental to alfalfa?

2. A worm that is stripping off the leaves.

3. Specimen presumably of embryo butterfly.

4. Butterfly appearing simultaneously with the worm. Thousands of them flutter daily over the fields.

What means are there of combatting these pests? Would you advise introduction of lady birds? Would turkeys help to exterminate the butterfly?—W. O. S., Coachella.

These specimens and the letter were referred to S. A. Pease of the Horticultural Commission of San Bernardino county. Mr. Pease writes: "All the specimens from Coachella arrived in very poor condition, yet some of them could be identified satisfactorily.

No. 1 referred to as a bee-like insect belongs to the family Bembecidae. It is the best known representative of that family, being Sphecius speciosus which preys upon Cicadas, stinging so as to render them helpless and carrying them off to their nests as provision for their young. It digs burrows in the earth sometimes two feet or more in depth, and provides each nest with a Cicada or locust.

No. 4 is a butterfly known as Colias Keewaydin, the larvae of which feed on alfalfa.

No. 3 is evidently the chrysalis or pupa of the above named butterfly.

No. 2 is in such a dried up condition as to be past positive identification but is possibly the larva of the above.

Probably one of the most difficult problems we have is to exterminate any biting insect on alfalfa, as the poison necessary to kill the worm would make the alfalfa itself unfit for feed. The only remedy which I know of is to use bran arsenic bait and that is not very effective."

We think the suggestion for the use of turkeys a good one Possibly it would keep the pests down to a certain extent, but we surmise that it would take a large drove of turkeys to effect a cure in some sections.

### Alfalfa Seeding.

What is the average yield of alfalfa seed per year? What is the average time required to mature the crop? Can a crop be practically threshed by hand, and are there cheap hand machines in the market?

**Sept. 6th -- Big Hatch**

**The Wm. H. Hoegee Co. Inc.**

**138-40-42 South Main, Los Angeles**

**Geo. C. Roeding, Fresno, Cal., breeder of Thoroughbred Holstein Bulls and Heifers Thoroughbred Berkshire Boars and Sows**

Oregon's crop of prunes is estimated at 40,000,000 pounds this year.

There is in this locality a worm that attacks the alfalfa in hot seasons and eats the leaves. Will stalks thus denuded yield good seed?—W. O. S., Coachella.

It is hard to give the average yield. Some have claimed as high as 600 or 700 pounds per acre, but that is extreme. 200 to 400 pounds is probably nearer to what the ordinary producer will secure. The time required to ripen the seed will be as long as required for two crops of hay. However, this period will vary on different soils and under different climatic conditions. We have never heard of a hand machine, and alfalfa requires much power to thresh, having to be rubbed instead of beaten out as is the case with wheat, we imagine a hand machine would not be satisfactory.

We cannot say positively, but would judge that the worm of which you speak is the larva of the yellow butterfly flitting over the fields so thickly, and suppose that the plant's weakened by its attacks would be affected as to quality and quantity of yield. The heat of your section may also be a factor in alfalfa seed production which experiment only can determine.

### Bleaching Figs.

Is there any way in which dried figs can be bleached after they have been cured?—J. J. H., Clovis.

We do not believe the practice is generally followed of sulphuring after curing and do not believe it would really be advisable for best results. Of course it goes without saying that the dark figs are never sulphured before or after curing, unless necessary to prevent their souring on the trays. The white fig may be sulphured lightly for fifteen, or not to exceed thirty minutes. Some have placed trays of figs in sulphur house over night, but this certainly is not beneficial. Do not let the fruit dry too hard. Place in sweat boxes for several days, and when ready to pack, dip in boiling salty water, or, as some prefer, in a thin boiling syrup. This leaves them in a more pliable condition so that they pack in better shape, and it also gives a better color. In sulphuring do not place on trays more than one deep, and if the fruit is sweet enough to dry without souring, we should greatly prefer unsulphured fruit.

### Johnson Grass.

I send sample of grass which is infesting my orchard. Is it harmful? I find that my fowls eat the young growth. Is Bermuda grass harmful in a citrus orchard? Would you advise planting alfalfa between rows of sickly lemon trees? The soil is good, but gophers, lack of water or this grass have nearly ruined the orchard through the neglect of past years.—G. H. M., San Diego.

The sample of grass sent is insufficient for us to determine what it is, but we should judge it is Johnson grass, one of the serious pests of the state. It, together with bermuda is certainly harmful to citrus orchards, and they should be given culture such as would prevent growth of these or other weed pests. As to the lemon orchard, we would suggest applications of manure or superphosphates followed by the planting in October, or possibly September, of vetches, peas, or fenugreek. Then give very deep plowing during February or early March to put these crops under. If any Johnson grass, Bermuda, or other pests remain, we would give thorough culture until they are destroyed. This, with plenty of water and handling soil so that no plowsole or hardpan will appear, will put the trees in bearing condition unless they have been so badly neglected as to be past saving. Only personal inspection could determine that fact.

### Failed In Milk.

My heifer freshened three weeks ago and gave at first a good flow of milk but is now giving only about two quarts a day She has the same feed as last year and seems perfectly healthy.—C. C., Perris.

These cases are not always easily explained. She may have taken cold or she may not have been milked out clean every time. Heifers are often slow milkers and it pays to rest a few minutes after the last of the milk seems to have been drawn and then try again for the last few drops. Rubbing and working the udder gently to secure the last drops will help. Sometimes a little feed given to a heifer while she is being milked distracts her attention and the milk comes more freely. Gentleness and clean milking will probably overcome this trouble.—M. E. S.

### Butter Slow To Come.

I churn twice a week the cream of one Jersey cow, in a dash churn at a temperature of from 58 degrees to 65 degrees. It takes from one to two hours to get butter and it sometimes will not gather when it does come. What causes the trouble?—Inquirer, Riverside.

Ripen the cream more fully by raising the temperature of the cream twenty-four hours before churning time, to about 90 degrees. This can be quickly done by standing the jar in hot water and stirring the cream, or it may be done by stirring the cream with clean glass bottles filled with hot water. Cover the cream and let it keep warm for an hour and then stand in a cool place, still covered, until churning time. Stir it a few times so that it will ripen equally. If the temperature at churning time could be brought down to 55 it would help the butter texture. Strain the cream into the churn to remove particles of curds and the butter will be good. Add no cream to the ripening cream after it has been heated.—M. E. S.

# Legal Queries

**Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.**

**Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.**

### Wife's Share of Estate.

What interest does the wife have in personal property and real estate when there are no children, no will being left? Does she have control at husband's death, or does the estate have to go through the courts, and at what expense to her?—Inquirer, Tulare Co.

If the property is the separate property of the deceased husband, the estate goes half to the surviving wife and the other half to the decedent's father and mother in equal shares, and if either is dead, the whole of said half goes to the other: If there is no father or mother, then half goes in equal shares to the brothers and sisters of the decedent, and to the children or grand children of any deceased brother or sister by right of representation, that is to say, the children or grand children of any deceased brother or sister would take the share which would have gone to such deceased brother or sister.

If the property is community property, half of the community property goes to the surviving wife, and the other half goes to the descendants of the deceased husband equally, if such descendants are in the same degree of kindred to the decedent, otherwise, according to the right of representation; and in the absence of such descendants, goes in the same manner as the separate property of the husband.

It is necessary that the estate be administered in the courts, and the expense will depend largely upon the value of the property and the amount of work that has to be done in order to probate the estate. This inquirer had better consult an attorney living in the county where the deceased died or in which he left property.—E. L. P.

### Pumping Agreement.

A and B own a well. A sells his half interest to B, retaining two inches of water to be pumped to him at intervals in each month, as agreed, at the actual cost of pumping the water. When the bill is presented for the month's pumping it includes a proportionate charge on A for sand pumping the well at its completion two months ago. Is this a just charge? B says without the sand pumping no water could be had. A holds it is a charge on the construction and repair of the well and is not a charge on the actual cost of pumping water.—Subscriber, Claremont.

Assuming the agreement to be exactly as set out in the inquiry, the

## WEDDING SUPERSTITIONS.

Married in January's hoar and rime,
Widowed you'll be before your prime.

Married in February's sleety weather,
Life you'll tread in tune together.

Married when March winds shrill and roar,
Your home will lie on a foreign shore.

Married 'neath April's changeful skies,
A checkered path before you lies.

Married when bees o'er May blossoms flit,
Strangers around your board will sit.

Married in month of roses—June—
Life will be one long honeymoon.

Married in July, with flowers ablaze,
Bitter-sweet mem'ries in after days.

Married in August's heat and drowse,
Lover and friend in your chosen spouse.

Married in golden September's glow,
Smooth and serene your life will go.

Married when leaves in October thin,
Toil and hardship for you begin.

Married in veils of November mist,
Fortune your weding ring has kissed.

Married in days of December cheer,
Love's star shines brighter from year to year.

—From Old Rhyme.

## DINING OUT.

"NOW," asked Mrs. Townsend, when they were in their places at the restaurant table, "what shall I order for luncheon,"

"Let me see the bill of fare," Janet said, reaching for it.

"In a minute," Jack answered; "I just want to see what kinds of soup there are."

"I don't want soup," said Janet.

"Neither do I," her mother added.

"But I'd like some of the mulligatawny. What's that like?"

"If you take soup, we'll have to sit doing nothing while you eat yours," Janet objected. "And, besides, one portion is more than you can eat, and it will be wasted."

"It won't save it to eat it any more than to leave it after it is paid for," was Jack's answer.

"You don't have soup usually at home," his mother remarked.

"That's why I want it. What's the use of going to a restaurant if you just eat what you get at home?"

"You're not here for amusement but to get some food." Janet observed.

"All right," Jack agreed; "then you can just eat oatmeal with bread and butter. That'll be cheap and filling."

Janet began to look cross.

"Here," Mrs. Townsend said, "let me take the bill of fare. I will order the luncheon." After a moment she looked up. "Suppose, Janet, you and I have some tea and fancy cakes, and for Jack I will order—some baked chicken pie."

"I don't like chicken pie. I'd rather have mock turtle soup and chicken salad and ice cream."

"That's too much," his mother replied, "and it's too expensive."

"Well, then," Jack grumbled, "if I can't have what I want, I won't take anything!"

"That's just like you!" Janet exclaimed. "You just go and spoil everything!"

"Well," Jack muttered. "I'm not going to guzzle tea and crumble dried up cake. I'd rather take chewing gum!"

Mrs. Townsend put down the bill of fare in despair.

"I do wish you wouldn't be so troublesome! I'm sure I can't suit you all without ordering a lot of things we don't want. And it's wasting money, too. All we need is a light luncheon so that you will not get too hungry before your dinner." She picked up the bill once more. "Let me see. What do you say to a nice salad with French dressing and some rolls?"

Don't like leaves," Jack muttered, while Janet looked equally unhappy, and asked: "Can't we have some dessert?"

"Dessert?" echoed Mrs. Townsend. "Yes, we could. Suppose we say rice pudding?"

This was the last straw. Jack went down to the depths of despair, and Janet's lower lip began to tremble.

"Well, children," their mother said, "shall I give the order?"

"I'd rather go without anything," was Jack's reply, and he turned indifferently from the table.

"So would I," Janet agreed.

"Have you ordered?" inquired a waiter, approaching briskly.

"Not yet," said Mrs. Townsend. "I'll let you know in just a moment. Come, children, what will you have?"

"You won't let us have what we want," Jack answered coldly.

"I'm sure I don't know what to do. You suggest ridiculous things and won't say yes to anything else."

"Women don't know what men like for lunch," Jack observed grandly.

"Oh, very well," Mrs. Townsend replied. "We can't wait much longer. Your father wished us to be prompt, so as to be in time for the matinee. Now he will be— Here he comes. I'm glad. If you don't like me to order, you can just ask your father."

Mr. Townsend came in briskly, smiling and gay. He made his way to the table, and greeted them affectionately. Then he noted the frost in the air.

"What's the matter?" he inquired. "Luncheon not served? Where's your waiter?"

"We couldn't decide what to have," said Mrs. Townsend. "Janet wanted some ice cream—"

"I didn't say so," Janet interrupted.

"And Jack chose mulligatawny soup—"

"Mock turtle," Jack corrected. "I only asked what mulligatawny—"

"That's neither here nor there," his father remarked, hastily consulting his watch. "And what did you want, my dear?"

"Only a cup of tea," Mrs. Townsend answered, "and some cake."

"That'll never do," her husband said, frowning and shaking his head. Then rapping sharply on the table, he brought the waiter on the run. "Here, waiter," he said, "bring two portions roast beef rare, with gravy, mashed potatoes, and have them served quick as you can. We're in a hurry!"

"Yes, sah," replied the waiter, and disappeared with a napkin trailing in the breeze.

"The longer you wait the less you can tell what you want. Roast beef is always in season, makes good red

blood, everybody likes it, and after all, there's nothing better. We've got just 20 minutes. Let's talk of something else."

And so they did.—Universal Magazine.

## RECIPES.

### Strawberries in Jelly.

While strawberries are expensive a very pretty desert and a toothsome one as well can be prepared by making a mild lemon jelly. Use a half box of gelatine dissolved in a scant cup of cold water, boil together, shave the lemon rind thin, using none of the white, steep with a small piece of stick cinnamon for ten minutes in a pint of boiling water, then add the soaked gelatine, a cup of sugar, half cup of lemon juice and when the gelatine is dissolved, strain. When it begins to thicken pour a little into a sherbet cup and place on it a couple of firm strawberries that have been wiped clean. As this hardens, add more of the jelly and berries until the cup is full, having it even on top. The berries may be served in the glasses with whipped cream piled on top, or they may be placed into moulds and the moulds turned out on a platter with whipped cream piled about them, or they may be served on individual plates with whipped cream, or plain cream may be used if preferred.

### Cherry Conserve.

Two pounds of stoned table raisins. Three pounds of red sour cherries. Three pints currant juice. Four oranges. Four pounds of sugar. Steam the raisins twenty minutes and then add the cherries sugar, oranges and currant juice. After it commences to boil, cook twenty minutes. Use the rind of one orange chopped fine.

### Lemon Pie.

One lemon, grated rind and juice. One cup of sugar One teaspoon of flour mixed in sugar. Four eggs well beaten. One-half teacup of sweet milk. One teaspoon of butter. Bake with one crust.

### The Famous Kumiss.

Kumiss is a valuable beverage for use in the sick-room Heat one quart of milk to seventy-five degrees Fahrenheit, add one and one-half tablespoonfuls of sugar, one and one-fourth of a yeast-cake dissolved in one tablespoonful of lukewarm water. Fill sterilized bottles to within one and one-half inches of the top. Cork, and shake. Place the bottles inverted, where they may remain at a temperature of seventy degrees Fahrenheit for ten hours; then put in the ice-box or a cold place, and let stand forty-eight hours, shaking occasionally, to prevent the cream from clogging the mouth of the bottle. It is refreshing and nourishing.—Woman's Home Companion for August.

### A Cocoa Egg-Nog.

A cocoa egg-nog is quickly made. Beat the white of one egg until stiff, and add gradually, while beating constantly, one teaspoonful of sugar, one teaspoonful of breakfast cocoa and a few grains of salt. Add to one half the mixture, while beating constantly, three-fourths of a cupful of cold milk. Turn into a glass and pile the remaining mixture on top.—Woman's Home Companion for August.

## MENDING SUGGESTIONS.

Until it has been tried, no one can realize what a lot of time and trouble can be saved by doing the family mending on the sewing machine.

Here is a good suggestion for mending overalls. Baste the patch firmly to the outside, turning in the edge as required, and stitch. Then turn the garment wrong side out, and stitch close to the edge of the patch also. By working slowly one can sew long patches over the knees of the overalls, and they will be stronger and look much better than when sewed by hand.

To refoot a stocking, cut from an old stocking leg a triangular piece about eleven inches long and six inches wide on one end, tapering it to a point. Cut the worn part from the stocking on a slant, then stitch the triangular piece and sew the straight edge together to form the heel. In this way no seams will come where they will hurt the foot. By varying the size of the triangular piece, stockings may be cut over to fit little feet, thus saving an item which means a great deal when there are several pairs of little feet to keep warm and dry.

## GOOD MEMORY.

An old colored woman down in Alabama was reported to be of great age, and was extremely proud of the distinction. The proprietor of a museum, on hearing of her, sent one of his agents to make an investigation, as she would be a valuable acquisition to his museum. The agent plied her with questions regarding her age. He asked her,

"Auntie, do you remember George Washington?"

"Does I remember George Washington? Laws a massy, mistah, I reckon I does, for I done nussed him when he was a chile."

"Well, I suppose you remember the Revolutionary war?"

"Yes, indeed, I does honey. I stood dar lots of times an' seen de bullets flyin' round as thick as hailstones."

"Well, auntie, how about the fall of the Roman Empire? Do you recollect anything about that?"

"De fact is, honey, I was pretty young about dat time, but I does 'member, now you speaks ob it, dat I hear de white folks tell' bout hearing som'pin' drop 'bout dat time."—Harper's Weekly.

Worrying is one of the greatest drawbacks to happiness. Most of it can be avolded if we only determine not to let trifles annoy us, for the largest amount of worrying is caused by the smallest trifles.

Angle Lamp
The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Malthoid Roofing

Saved the lumber, coal and building plant of A. I. Schowalter & Co., of Halstead, Kan., from fire last March. The south wind blew the flames from a barn filled with hay directly on the sheds of this company. These sheds were roofed with Malthoid, while the sides were covered with corrugated iron. The heat was so intense that it ignited the wood back of the corrugated iron and it was only with difficulty extinguished. The fire-resisting qualities of Malthoid Roofing saved the roof, which was subjected to the most heat.

Malthoid Roofing is fire-resisting and durable.

### Hay.

Scott & Magner say:—Receipts of hay on the San Francisco market for the week ending today have amounted to over 5000 tons. This is the largest week's arrivals that we have had since last summer.

With no increase in the demand here in San Francisco, these heavy receipts have burdened the market to such an extent that prices have weakened, the movement of this bulk of hay has been slow, and the general feeling throughout the entire market is one of exceeding dullness.

A little choice wheat hay commands our topmost prices, but there is only an occasional car offered of this high type of hay. The bulk of arrivals consists of No. 1 wheat and of Wheat and oat, which is selling down to $13.00 per ton. There is a great deal of nice volunteer oat and oat and barley, which varieties of hay have also been lower through this week.

The large quantities of hay that are still in the fields, and for which there are no storage facilities, will have to be moved shortly. Therefore, it is anticipated that the prices that prevail in San Francisco today cannot be maintained when the heavy bulk of hay begins to be crowded into the market and offered for sale.

There is a little more alfalfa hay coming in now, but the market is not strong, as the dairymen are not prepared to pay any high figures. Off grades of alfalfa move very slowly, but the choice lots sell more readily.

This week's quotations are:
Choice wheat hay .....17.50@18.50
No 1 wheat or wheat & oat 16.00@17.00
No 2 wheat or wheat & oat 13.50@15.00

## Deciduous Market

SACRAMENTO, August 4, 1909.

Prices which have been received for the last few days for all lines of deciduous fruit have been very satisfactory. From 85 to 125 cars are going forward daily. Prices of fruit for the sales made on Friday by the California Fruit Distributors were as follows: Philadelphia—Bartletts averaged $1.60, Crawfords 85c, Tragedies $1.05, Germans, $1.15.

Chicago—Bartletts $1.80, Elbertas 90c, Crawfords 65c, Tragedies $1.40, Eggs $1.10, Sugars 1.25.

Boston—Bartletts $1.90, Crawford and Fosters 85c, Sugars $1.40, Eggs $1.30, Bradshaws $1.10, Imperial Duanes $1.85, Wicksons and Diamonds $1.65.

New York—Bartletts $2.30, Crawfords 95c, Tuscans $1.05, Eurekas $2.25, Abundance $1.37, Eggs $1.50.

On Saturday: Boston—Bartletts $1.90; peaches 85c; plums from $1.10 to $1.85.

Chicago—Bartlets, $1.80; peaches, 65c to 90c; plums $1.25.

Philadelphia—Bartletts $1.90; peaches 85c; plums $1.10.

New York—Bartletts $2.30; peaches 95c; plums $1.50; Eurekas $2.20.

The Fruit Echange for Friday reports: Boston—Crawfords, boes, 50c@$1; Crawfords, crates, 60c@$1; Tragedies, $1.30; Sugars, $1.25@1.50; Deckers, 75c@$1; Wicksons, $1.30@1.55; Egg, $1@1.50; Diamonds, $1.30@$1.70; Bartletts, $1.50@2.15.

New York—Bartletts, $2@$2.85; Crawfords, 75c@$1.25; Fosters, 90c@$1.25; Tuscans, $1@$1.40; Germans $1@$1.75.

Philadelphia—Crawfords, 80c@85c; Fosters, $1.05@$1.10; Tragedies, 85c@$1.10; Bartletts, $1.85@$2, Sugars, 75c@95c.

Cleveland—Pears, $1.80@$2.25; Crawfords, $1; Fosters, 85c@$1; St. Johns, $1; Wicksons, $1.30@$1.80; Sugars, $1.20¾$1.55; Tragedies, $1.65.

Chicago—Bartletts, $1.80@$2; half Bartletts, $1@$1.05; Tragedies, $1.10@$1.65; Muscats, 30c@$1.25; Malagas, 30@95c; Thompson seedless; $1.35; (grapes show mold).

And for Saturday: Philadelphia—Bartletts, $1.90 to $2.15; Crawfords, 80c@$105; Germans, $1.15@$1.35; sugars, $1.05@$1.20.

Minneapolis—Crawfords, 65c@80c; St. Johns, 55c; Tuscans, 55c; suagrs, $1.40@$1.50; eggs $1.35; Comedy $1.15@$1.45; Bradshaws, 90c@95c; Kelseys, $1.55@$1.60.

New York—Bartletts, $2@$2.75; Crawfords, 75c@$1; Deckers, 80c@$1.05; Tuscans, 85c@$1; Fosters, 75c@$1.05.

# Citrus Market

LOS ANGELES, August 4, 1909.

Oranges are still going forward at a liberal rate, but as for the past few weeks seedlings and sweets have not commanded satisfactory prices. This has been especially true in the auctions which have reflected the general market condition. Of course there are but few cars left of others than Valencias, but at the rate others have been selling, it hardly looks as if it is worth while to ship the few that are yet to go. With a large number of Valencias there can be but little showing up in the shipments, so it is probable no exceptional or record prices will be made this year, though it is hoped, and it now appears, that for good stock fair returns may be secured.

Lemons are manifesting a much more satisfactory market condition. The weather for the past week has been exceptionally warm in some parts of the East so that the demand has been greatly stimulated. The shipments have slowed up somewhat and from now on to the end of the season will be lighter, though it is possible that the rest of this month will see an average of close to 30 cars per day. From present indications the September shipments will be much lighter. This would indicate good prices for the remainder of this season. At present there are about 185,000 boxes of foreigns afloat this year as against 150,00 last year at this same date.

**Shipments.**

Total shipments of citrus fruits to date this season, 34,429 cars, of which 29,075 were oranegs and 5354 lemons. To same date last year, 27,276 cars, of which 23,242 were oranges and 4,034 lemons.

---

NEW YORK, Aug. 2.—Fifteen carloads or oranges and two carloads of lemons sold. Market weak and depressed. Weather hot and sultry.

(Continued from Page 139.)

only charge which A would be obliged to pay would be for cost of lifting and delivering the water to him, and I presume that is the true intent and meaning of the agreement, and therefore, a charge for any prior repairs, or sand pumping, or for sinking the well, or erecting the pump, etc., would not be legitimate.—E. L. P.

---

### Water Rights.

A stream rising on the land of A. flows through lands of B, C and others, none using the flow except for watering stock. Can A legally sell to B his surplus water to be used for irrigating purposes?—O. L., Santa Rosa.

Assuming that neither B, C or any other person has acquired rights in the flowing stream, A might, of course, sell the surplus water; but if a person has had the continued, notorious, uninterrupted and adverse enjoyment of the water or a portion thereof, during a period of five years, the law will presume a grant of the right so held and enjoyed by him, and then A could not deprive such a person of his right by selling to some one else.—E. L. P.

---

### Land Rights With Water Locations.

What land rights, if any, go with tunnel, headgate, and pipe line locations?—W. D. R., Los Angeles.

Such land rights as are reasonably necessary for the use of the tunnels, head-gate and pipe line.

Under the recent mining law, I think that perhaps one might locate a tunnel site for developing water, which said site would be of certain dimensions, but there is no law defining the exact quantity of land to which a locator of water right is entitled. Each case must be governed by the circumstances surrounding it. —E. L. P.

### Remedy for Heaves.

The following I have found a good remedy for heaves which will always help and often cure. One pound each of fenugreek, saltpeter, copperas, and ginger, best Jamicia. Mix well.

Dose one-half tablespoon mixed each morning and evening in grain. It is better to slightly dampen the grain, until the horse is better. After that a dose once or twice a week will be sufficient Never feed musty hay to horses.

To remove film from eye of cattle or horses. Rub a little common hog's lard in eye with the finger. Be careful not to hurt eye, but get lard under the lid. If careful, animal will not object after one or two treatments. I have used the above for many years with best of success

I have been a subscriber and reader of California Cultivator for many years.—Wm. C. Campbell, Whittier, Cal.

---

### IRRIGATION EXPERTS TO MEET AUGUST 9.

The most important irrigation congress ever called together in the United States will Convene at Spokane, Wash. August 9th to 12th.

Many of the brightest minds of the country will assemble at this congress and mighty matters relating to irrigation and kindred subjects will be presented and discussed.

F. H. Newell director of the Government reclamation service and famous for the prominent part he has taken in all the great irrigation projects of the day, will be present. Important papers will be presented by James J. Hill, president of the Great Northern Railway; George C. Pardee, former Governor of California; Dr. Enoch A. Bryan, president of Washington State College; R. E. Campbell, of the forestry branch of the Canadian Department of the Interior; E. T. Allen, United States District Forester; Bailey Willis, United States Geological Survey; Dr. W. J. McGee, secretary of the Inland Waterways Commission; Clarence Johnston, State Engineer of Wyoming and many others famous in the irrigation world.

One of the most interesting features of the congress will be an address on "Soil Utilization" by James Wilson, Secretary of Agriculture in President Taft's Cabinet.

Owing to the wide scope of the subjects contemplated and the remarkable talent assembled, this National Irrigation Congress promises to be the greatest one ever held in the United States.

"The American Weekly" with its own special men on the ground and its own perfectly equipped art and editorial staff, will present to its readers a complete and authentic account of the proceedings, constituting that number a liberal education in the science of irrigation. "The American Weekly" is a purely Western newspaper, devoted to the West and its interests, with special attention to the Pacific Coast States.

As will be seen by its advertisement in this issue, the Irrigation number and the three succeeding issues will be sent to any address for ten cents.

---

### GUM DISEASE.

We have received a small booklet of fourteen pages which will have much of interest for citrus growers who have been having trouble with gum disease in their orchards. The booklet discusses the gum disease, its cause, manner of prevention, and means of securing better growth of tree after cure. It is written by Mr. John A. Lehman of Glendora. Mr. Lehman maintains that the cause of the disease is purely physical and shows by illustrations where experiments have been performed which prove his theory. In a word his theory is, "Partial interruption of circulation in some roots with soil surrounding obstruction in the required condition to produce fungus." His remedy is, "A cure in all cases can solely be obtained by removing the obstruction." The price of the booklet is fifty cents and may be secured from the publishers, Baumgardt Publishing Co., Los Angeles.

---

### Hay Houses Merge.

The hay houses of Scott & Magner and W. A. Miller & Co. are to merge their interests, and form one large incorporated company, with branches all over the state. It will be known as the Scott, Magner & Miller, incorporated, and the officers will be Joseph Magner, president; W. A. Miller, vice-president, and A. W. Scott, Jr., secretary-treasurer. The corporation has leased the Hollis building at California and Market streets and expects to open its offices there early in August.

**What is the Market Price of Your Produce Today?**

Mr. Farmer, the *"Daily Market Reporter"* is the only paper that can give you this information absolutely correct. Do not depend on the newspapers. Read the official paper of the Produce Exchange of Los Angeles for market information. Published "daily" immediately after the call on the Exchange.

60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it fails to do this, **any** money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

Write for Catalogue.

Have you heard of the Nix-Frost Crude Oil Gas Producer? It's "The Cheapest Power on Earth."

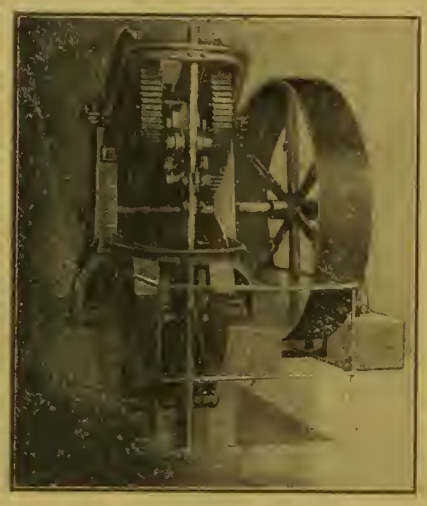
# The Smooth Running, Noiseless Pomona Deep Well Pump



It is thirty to fifty per cent more efficient than any centrifugal pump ever made. No high speed bearings to cut out. All breakages and rod troubles eliminated.

This is the only pump you can afford to buy if you consider your own interests. Hundreds of satisfied users testify to this.

Used by the best water companies who know what a good pump is.

Send for a catalog or what is better come to POMONA and let us show you some of these plants in operation.

**POMONA MANUFACTURING CO.**

**POMONA, CALIFORNIA**

THE

# Latest Deep Well Turbine Pump

Guaranteed to deliver from 100 gallons per minute upwards, depending on the diameter and capacity of well, from a depth of 50 to 300 feet below the surface. Can be either belt driven or direct connected to electric motor as occasion requires.

Write for Catalogue 46B.

A deep well pump that has no valves or plungers to wear or get out of order, no gears, consequently no noise or breaking of teeth.

Compact, durable, always primed and ready to operate, constant flow, hence increased capacity of well.

This type of pump is fast taking the place of Vertical Steam Deep well Plunger and Propeller Pumps.

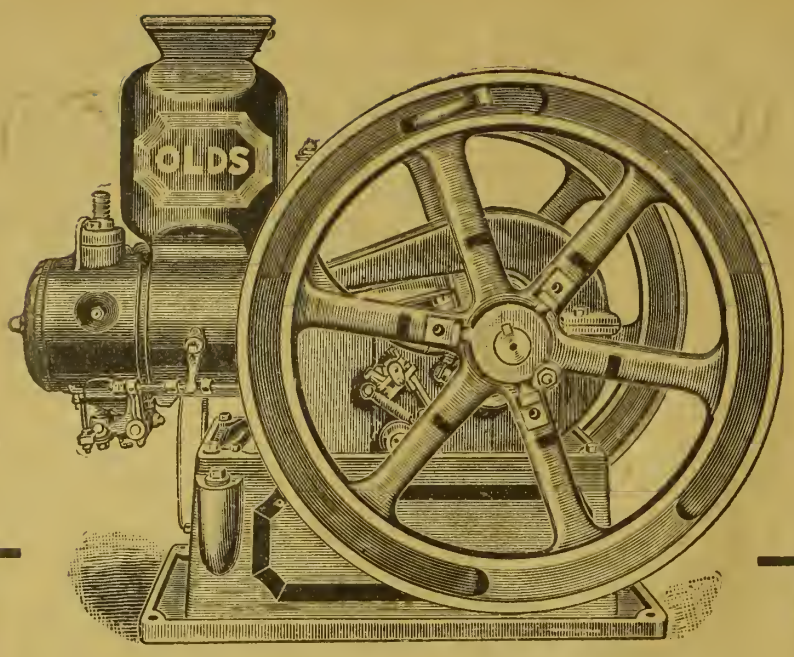
# Stanislaus County's Wealth Producers

## A Group of Registered Dairy Cattle on Pastures in Modesto-Turlock Irrigation District

STANISLAUS county usually called "Sunny" and now fast acquiring the additional name "Progressive," is making rapid strides in settlement and development. This state has from earliest times been a land of transformations. Among the great changes that have taken place none are more marked than those on the rich lands of Stanislaus county in Central California. Originally this was a cattle and ranch country. Later it was devoted to hay and grain which made wealth for many and caused the erection of numerous warehouses along the lines of the railroads. Some six or seven years ago the great Modesto-Turlock irrigation system was completed, water was turned into the canals, and alfalfa, the king of forage plants, has taken the place of the hay and grain. The fields are not by any means given over to alfalfa, for tomatoes, beans, peas, asparagus, berries, melons, and fruits are wealth producers. Active factors in the advancement of this section are the Modesto and Turlock Chambers of Commerce.



# Send for Our New Catalog

## Do Not Think of Buying a Gasoline Engine without it.

The things that should decide you in selecting the right engine are: **what will it cost to run the engine**—(1) how much gasoline does it use; (2) how many parts are there to get out of order; (3) what will the repairs cost; (4) will the mixer always work;(5) will the gasoline pump get out of order; (6) if water is left in the engine and it freezes, what will have to be replaced; (7) if it is guaranteed, what is the guarantee worth.

## The Olds Engine

**is the most economical engine to run**

(1) the gasoline cost is very low because the new Seager mixer automatically makes exactly the right mixture of gas and air all the time.

(2) it is the simplest because it has no small delicate parts to get out of adjustment.

(3) You are guaranteed against buying any repair for one year because we make the following proposition.

**We agree to replace, free of charge, any part of an Olds Engine that breaks or becomes worn, from ANY CAUSE WHATSOEVER, within one year from date of shipment, provided the replacement is one you think should be borne by the manufacturer. YOU ARE TO BE THE ONLY JUDGE. There is to be no argument, no delay in returning old parts and getting new ones, you decide and I abide by your decision.**

This makes a big possible saving to you the first year when 99 per cent. of your troubles would naturally come.

(4) The Seager mixer has **no moving parts**—once adjusted it is adjusted for a lifetime.

(5) **The Olds Type A Engine has no gasoline pump. The piston sucks the gasoline into the mixer automatically.**

(6) The Olds water jacket is a separate casting. In case of freezing this part alone can be replaced at slight expense, instead of having to buy a whole engine bed and cylinder.

(7) A guarantee is limited by the financial responsibility of the concern making it. Ask your banker whether we are good for what we say.

There are cheaper engines made that are painted just as prettily as ours, and their catalogues contain many tempting claims, and make many attractive promises, but in spite of all that has been claimed and promised about other gasoline engines selling at all kinds of prices, we have been making steadily for **30 years an engine that has become the standard of the world.**

An engine that is as finely built as the Olds, that has Olds quality of material and workmanship, backed by our kind of guarantee, or with a record of so many thousands of satisfied customers, **could not be successfully sold for any less than our price.**

J. B. SEAGER, Gen. Mgr.

**Seager Engine Works**

**Formerly Olds Gas Power Co.**

**Main Office and Factory 993 Seager Street**

**LANSING, MICH.**

Every man has a hobby. Mine is building engines that are so good the user will want his neighbor to have one. I insist on every Olds Engine becoming an Olds salesman.

Anybody can paint a cheap engine to look good; I never built cheap goods and never will. When I took hold of ths business my task was easy because I did not have to start a new concern. It had already gone through over twenty years of success. The Olds Engine was a magnificent engine, but now it is 100 per cent. better than ever before—better material; better mixer; no gasoline pump; automoble quality cylinder; jump spark ignition—five parts only, all of which are stationary—instead of thirty moving parts as in the old style igniters; removable valves; simplicity; three separate inspections; economy and certainty of operation.

Everyone will be satisfied with an Olds Engine—he cannot help it. I care more for having a pleased Olds user than I do to sell a large number of engines. Every user of an Olds Engine must be satisfied—I will not have any other kind of a customer.

I guarantee every Olds Engine to be in perfect running order when it leaves the factory. I know the engine you get is all right, and that the high Olds standard is maintained. If is the best you can buy, whether you pay more or less than the Olds price.

J. B. SEAGER, Gen. Mgr.

The United States Governmcnt uses them in its military posts, government work of spraying and irrigating, because the Olds Engines have stood the most severe tests they could put them to.

**Every farmer** who requires an engine **can afford an Olds Engine.** It does not pay to buy a cheap machine of any kind, and the price you pay for an Olds is only a slight per cent. over what it costs us to build them right. We make so many a year we can afford to have our percentage of profit small. You are really getting an engine of the very **highest possible quality at the right price.** In fact you get **all** of your money's worth—one hundred cents worth for every dollar.

Our catalogue mailed you free tells you just what you should know about an engine. Write for it today before you forget it.

Write me personally telling me what you want the engine to do, and you will get a personal letter from me that will give you the facts you want. To save time you can write to my nearest representative.

# LA GRANDE BEACH LOTS

NO INTEREST NO TAXES

## $30 BUYS A LOT

**$1 Down** And That's All **$1 a Week** For 29 Weeks

**$1** YOU CERTAINLY CAN invest $1 in a lot 30x118 at one of the finest beach resorts on the whole CALIFORNIA COAST, where more than $50,000 has already been spent in improvements and as much more will be spent in the next year.

THIS PROPERTY **$1** has changed hands at an enormous sacrifice to former owners, and the lots that formerly sold from $300 to $1000 can now be had at from $30 to $250. If you want a snap bargain, act quick, for they won't last long at these prices. There will be things doing at LA GRANDE BEACH. The right people are behind the proposition and will make it go. These lots will advance 10% after 1000 lots are sold.

### Own a La Grande Lot

**Reasons Why You Shonld Invest in La Grande Beach**

1st. BECAUSE it is destined to be a world renowned summer and winter resort.
2d. BECAUSE it is on the main line of the Southern Pacific Railroad.
3d. BECAUSE all the improvements are permanent and built of the best material that money could buy.
4th. BECAUSE it is the grandest beach that eyes ever gazed upon.
5th. BECAUSE the back country is one of the most fertile spots in California.
6th. BECAUSE it is located midway between San Francisco and Los Angeles and north of Santa Barbara. Visting tourists have easy access to it.
7th. BECAUSE it is an ideal place for bathing, boating, fishing, hunting, and its winter climate is second to none.
8th. BECAUSE the lots are becoming more valuable each day on account of its popularity.
9th. BECAUSE a holder of a deed to a La Grande lot has a tangible asset.
10th. BECAUSE there is only a limited amount of beach property in California, and La Grande Beach is the cream of the Pacific Coast.
11th. BECAUSE these lots were put on the market in 1907 and sold on an average of $300. Some were sold as high as $1000.
12th. BECAUSE this beach has the finest and purest soft water for domestic use.
13th. BECAUSE the prices of these lots at present are only about 10 per cent of their real value.
14th. BECAUSE all lots in La Grande Beach are sand lots.
15th. BECAUSE it is the healthiest place in the world. If you are run down and have that tired feeling, go to La Grande Beach for two weeks and you will feel like a new person.
16th. BECAUSE more than $50,000 has already been expended in improvements and as much more will be spent the coming season.

# Irrigation Demonstrations at Spokane

## A Plat of Ground Showing Fourteen Irrigation Practices

FOURTEEN approved methods of irrigating, adapted to practically every kind of land and the various tree, root and vine crops, are being demonstrated on a 15-acre tract in the Spokane valley within a stone's throw of the city limits in connection with the 17th session of the National Irrigation Congress in Spokane this week. The purpose is to afford the delegates to the Congress and visitors an opportunity to study the best known means of supplying moisture by artificial means to orchards, berry and sugar beet fields, vine-yards and hay and grain lands. There are also demonstrations by manufacturers of apparatus used in modern irrigation. Ten acres of land has been set aside for displays of machinery.

What is considered by experts to be the acme of scientific irrigation and at the same time the most economical method is being shown in the use of porous tile pipe laid under the ground. The principle is the antithesis of drainage in that the pores and joints of the pipes give out sufficient water to supply the plant life above them. This plan is declared to be practicable in supplying moisture for fruit trees, vegetables, berries and almost every kind of product, the advantage being that the water carried by the pipes is discharged directly below the roots of the plants, instead of on the surface of the soil.

In comparison with the foregoing plan there is being shown the primitive method, practiced by irrigators before it was learned how to distribute water economically and to the best advantage. No grading or leveling was done on this tract; in fact, in contour it is as Nature left it. Water is taken to the highest point on the land to distribute itself over the ground. The idea in this is to show waste of water and soil by washing and erosion.

The individual system, also demonstrated, calls for piping water to every tree. To make it effective the water must have a head. The pipe, which may be small, is run to within three feet of a tree to discharge water into a circular ditch or basin built around the tree. This method is desirable in districts where a small amount of water is desired to do a large amount of irrigating. There is no loss from evaporation or seepage, and only the ground in which the tree grows receives the water. The cost of installing this system is much larger than for the open ditch or flume system, but the difference is soon made up on the cost of water, or where it is paid for by the acre-foot.

Subirrigating by means of open ditches is also shown. The ditches are of such depth that the water is absorbed without moistening the surface. This method is advantageous where soil has a tendency to bake or become crusted after watering.

Two tracts show the practicability of watering steep land in open ditches. The inclines on one tract are from 30 to 45 degrees. The other shows the terrace system, water being dropped from one terrace to the other. Land can be irrigated by this plan without washing or erosion.

One form of the corrugation system is applied to soil where the land slopes in more than one direction, the ditches being made to follow the natural contour, which needs no grading. Water is supplied through one box and the ditches spread out in fan shape over the land.

Another plan of the so-called corrugation idea, best adapted to sugar beet, alfalfa and grain lands with a gentle slope, shows water distribution by means of V-shaped ditches or rills, 2½ inches deep and about 18 inches apart. The marginal dike or basin system of irrigation shows ditches built surrounding the tract of varying size running from one acre to ten acres in area. To practice this method successfully the land must be level or have only a gentle slope. Sufficient head may be had in the water itself to cause it to spread over the ground.

On another tract is the dike system, which follows the natural contour of the land. This method is adapted to ground with a slope, but is not practical for level land. It is similar to the side dike system, but the first cost is less and the results not as satisfactory.

The side dike system is used to best advantage on ground with a uniform slope. The method is to build dikes 100 feet apart, from eight to twelve inches high, depending upon the character of the soil. Water is taken from the head ditch and spread in a sheet over the areas between the dikes. The surplus passes into a ditch and is carried to the next area.

The sprinkler plan calls for spray-sprinklers arranged between the trees or vegetable rows and so placed that they water all of the ground. This system can be used only where water is supplied under pressure.

Another system is to distribute water to each tree in an open flume. The water is supplied from a head ditch. This is similar to the piping method to invidivual trees, but is a waste of water, though the cost of installation is less.

C. M. Speck, chairman of the practical demonstration committee of the irrigation congress, is assisted in the demonstrations by H. Delepine, an experienced engineer, who has charge of the work, and practical irrigators and growers from various parts of the United States and Canada, in explaining the various methods of watering land to obtain the best results at the least cost.

One of the Ditches Carrying Water to the Individual Farm, Modesto-Turlock Irrigation District, Stanislaus County.

# Marking of Tents for Practical Fumigation

## R. S. Woglum, Agent of the Bureau of Entomology, says no Patent will Prevail other than the one Possessed by the Department

DURING the fumigation season of 1908, I introduced in Southern California an improved system of fumigation of which one of the important factors was the marking of tents with three graduated parallel lines. Recently Mr. W. H. Payne, of Monrovia, has caused considerable disturbance among citrus growers through the information that he has a patent on the marking of fumigation tents and threatens to sue people should they mark their tents to utilize my system.

It happens that Mr. Payne has patent No. 731,610, issued in 1903 on the marking of fumigation

# With the Citrus Growers

"IN CALIFORNIA."

REPORTING on conditions prevailing in California packing houses the packing house committee of the visiting members of the Florida fruit growers make the following report:

In California we found large, modern, well ventilated and lighted packing houses the rule, and not the exception. The use of labor-saving devices prevailed everywhere with the Californians; no expense is too great to incur in the saving of a cent or a few cents in the handling of a box of fruit. We believe that the Californian growers, on account of modern equipment, save not only millions of dollars by careful handling, but also fully ten cents per box in packing. Estimating the present Florida crop at six million boxes, the 10 cents per box that could be saved to the Florida growers this year by having up-to-date packing houses and appliances, would amount to the sum of $600,000.00, an amount sufficient to build and fully equip sixty modern packing houses, costing $10,000 each.

**Packing Houses.**

The California packing houses are well constructed, large, roomy, well ventilated and lighted, so that large quantities of fruit can be handled daily without crowding and conjestion.

Every packing house is provided with electricity which furnishes power for running all machinery as well as artificial lights when needed.

Every packing house we visited was found to be scrupulously clean and its contents methodically arranged.

**Neat Offices.**

Office equipments and telephones we found everywhere. In fact the general appearance of every packing house visited compared favorably with our best regulated wholesale business houses in point of convenience and neatness.

Clifornia spends thousands of dollars for packing house equipment, where Florida spends hundreds. The most of these packing houses and their equipment range from five to seventy-five thousand dollars each, the average cost being in the neighborhood of ten to fifteen thousand dollars. We found various devices for washing and sizing, and also carriers for the easy handling and movement of the fruit. It would require a report of too great length to atempt to explain the different systems used by the various packing houses visited, therefore will confine ourselves to a packing house visited at Duarte, as embodying practically all the essential conveniences found in the others.

**Model Packing House.**

If you will follow us from the field box just unloaded from the wagon, we will take you through this packing house and attempt to describe the various movements of the fruit and machinery used in moving it. The field box is placed on a platform, or automatic dumper about two feet from the floor, the machinery slowly tilts the box over and empties the fruit slowly on a slatted hopper, the bottom of which is made with rubber tubing spaced so as to allow the dirt, leaves and trash to fall through into a receptable placed underneath. We would have you note that the second box is not emptied into this hopper until the first box is out of the way. So different is this arrangement from many of the Florida packing houses, where you will find fruit piled from one to two feet in height in the hoppers. From this slatted hopper the fruit is carried by gravitation, or by belts in some cases, to the washer, which, in this house, consists of three fiber brushes about six inches in diameter and four feet long placed side by side with the lower end slightly inclined downward. Placed end to end to these brushes are two sets or units, of brushes, also inclined downward. These units furnish a brush space of twelve feet in length and about eighteen or twenty inches in width. These brushes are operated by electric power, and the fruit passing over them is continually sprayed with fresh water from an overhead perforated pipe. During the movement of the fruit along these brushes it is thoroughly cleaned and washed. From the brushes the fruit is carried, by an elevator, to the drying racks, which are made with slatted bottoms and suspended from overhead. These racks are approximately six feet wide and eighteen or twenty feet in length, suspended so as to incline slightly downward at their farther ends. When these dryers are filled with fruit they are gently shaken up by an attendant, which causes the water to fall through and from here the fruit is passed on to a slow moving wide belt which runs through a box-like affair, through which a draft of air is forced so that when the fruit reaches the farther end of the box the fruit is perfectly dry. Here in front of the slow moving belt sit the graders, and here will be found other belts running parallel on which second and third grade fruit is placed, the first grade going forward on the belt from which the other grades are taken. The culls are usually cared for by a belt placed underneath and running in another direction. The graded fruit now goes forward to automatic weighing machines so adjusted that whenever the hopper of the weighing machine contains twenty-five or any required number of pounds, the hopper automatically tilts and registers the number of pounds of the various grades. From this record the number of pounds of each grade supplied by any grower is ascertained, and proper credit is given this grower and when sold settlement is made accordingly. Now from the weighers the fruit falls on belts which convey each grade to its respective sizer. Remember the fruit is all the time going forward without stopping, moving like clock work to the box. All of the sizers in this particular house are of the roller type which consist of wooden rolls or rollers of different diameters. In some of the packing houses we found the rope sizers, in others the fruit was carried forward and at intervals were placed crossed belts at various heights above the main belt so that the orange in its movement forward would be diverted to one side when it touched the belt corresponding to its size. In other houses electrically charged rods placed over the running belts at

various heights, so that when the oranges touched one of these rods in its movement forward it would be electrically kicked off the belt into its proper bin. In the bins we now find sized fruit, washed, dried and without incurring any damage whatever. Here the packers (principally women) wrap and pack the fruit. The packing boxes are then placed on belts, or gravity conveyors which carry them to the cooperer who with a slight shove rolls the boxes under the press. This movement automatically registers the number of boxes. When coopered, a single movement sends the box to the car where it is loaded, precooled and iced, and is then sent over snow-covered mountains, through alkali deserts, to a market two thousand miles from the shipping point much farther than is needed for our Florida fruit.

**Box Making.**

A few remarks on box making and wrapping machinery and then I am done: In every packing house are to be found automatic box making machines operated by electricity. Into a receptacle are placed the heads, and in another receptacle are placed the sides. The heads and center piece fall automatically into their proper places, one side (which consists of two pieces) falling on top of the heads and properly spaced. These sides are automatically nailed and the box turned by one movement of the machine. The same process is repeated for the two other sides of the box, and then the box is automatically kicked off and the number made recorded. The completed boxes are placed on gravity or belt carriers and sent forward to the packers. Two men and machine can turn out from two to three thousand completed boxes per day.

In one packing house we found a wrapping machine operated by electricity. These machines appear to be complicated and expensive, and until they are fairly tested, we think our Florida growers can invest their money to better advantage in buying more needed appliances of proven merit.

## SOME EXPERIMENTS WITH AN ORANGE.

Experimenters in need of chemicals may sometimes do without the druggist. The soil, plants, animals, are but chemical laboratories; in one orange, chemicals are found in such a number and of such a nature as to enable anyone to perform several curious experiments. Most of the readers of the Scientific American probably have read about or used the sympathetic ink which is obtained by merely dipping a pen into the juice of the fruit. The sudden apparition, on the heated paper, of the hitherto invisible script is one of the pretty experiments which can be made with orange juice. Those which the writer is about to describe have more to do with the physiological than with the strictly chemical properties of the fruit.

Sugar and a considerable amount of citric acid are found in a ripe orange. Besides the taste, a good proof of the presence of a true acid in orange juice can be had by boiling in water a few red cabbage leaves and then letting some orange juice fall into the bluish decoction. The instantaneous change from blue to red reveals the presence of acids even when taste fails. It may be a matter of surprise to many to learn that the strong sugar and acid flavor of orange juice cannot be perceived by a considerable region of our gustative organ. The middle anterior part of our tongue is as insensible to these two flavors as the punctum caecum of our retina is insensible to light. The fact was ascertained for the first time, I believe, by the scientist Schreiber, who carefully fixed the boundaries of the insensible regions of the tongue for many substances, among which were sugar and citric acid. The unresponsive area corresponding to sugar does not coincide everywhere with the area of insensibility for citric acid, but it shows at the same time the existence of a large territory common to both. Cut a small piece of peeled orange. Express it slightly, so as to avoid the dropping and running of the juice over the tongue. Place it in contact with your tongue at nearly one inch from the tip. You will find the orange absolutely tasteless. Bring forward the same piece of orange on to the tip of the tongue, and the strong sugar and acid flavor instantaneously reappears.

It cannot be said that a part only of our gustative organ is insensible to the taste of the essential oil contined in the orange peel, for it is the whole tongue and mouth which do not perceive it. To say this while everyone knows the powerful aromatic taste of orange peel seems foolish enough, yet it is true. That particular taste is not a taste but a smell, perceived with the nose only, and many other sensations called tastes have not the slightest right to such a title. Yet the statement that such condiments as vanilla or peppermint are tasteless, is sure to arouse considerable opposition if you make it after dinner in a company of laymen. Ask the most determined of your contradictors to leave the room for a moment, and meanwhile cut into small pieces some of the outer, yellow peel of an orange, which you place in a spoon. Your opponent is then requested to close hermetically his nose and to enter the room. When he is near the table, you ask him moreover to close his eyes, and to eat and name the spoonful of food you place in his mouth. As long as his fingers press his nostrils, no amount of chewing or swallowing will enable him to comply with the latter request.

Yet it is not probable that any part of any plant is much richer in essential oil than the yellow epicarp of the orange. It is so loaded with the odoriferous liquid, that any change in its shape will produce tiny jets which spring in every direction. To observe these, light a candle and bring near it a piece of orange peel held between thumb and forefinger. Double and press the peel, the yellow side facing the candle. Pretty streaks of fire will be seen to start from the candle up to several inches away from it. They are produced by the ignited jets of essential oil.—Prof. Michaud in Scientific American.

---

The Farmers Union of Washington, Oregon and Idaho, has decided that it will refuse to allow the deduction of one pound on every sack of grain weighed. This has been the custom in the past and has deprived the farmers of those states of a half million dollars annually.

**Less Work— Dainty Dishes**

No woman realizes how much work she could save, and the tempting variety of dishes she could offer at the table, until she possesses a Keen Kutter Food Chopper.

Just a few turns of the handle instead of the tiresome chop, chop at the chopping bowl. Meat, fish, vegetables, fruits are chopped uniformly, coarse or fine as you wish. The

# Deciduous Fruit Culture

By J. W. Mills

### WHAT HONEY DEW IS.

THE impression seems to be prevalent in Sacramento that the presence of the elm aphis on the city shade trees is a newly introduced pest. This is a mistake. The elm aphis have been with us for many years, and the present scourge, as it may be termed, is a good illustration of the work that, in ordinary years, is accomplished by beneficial insects.

Occasionally peculiar climatic conditions arise, whereby the natural insect enemies of the aphids do not get an even start with the pest, showing what damage, loss and annoyance we would be subjected to if these various beneficial forms were suddenly to be removed.

The good work they do every year in preventing such losses is never known or appreciated until we are compelled to pass through a "honey dew siege" like the present one. It also serves to admirably illustrate the work of the State insectary in Capitol Park, and to show the need of fostering our native beneficial insects, which are more powerful in combatting insect pests than any other force in nature and have, in many cases, completely subdued insect invaders that have baffled the entire entomological intellect of the world.

In the particular case of the elm aphis, usually the several species of lady bugs, syrphus flies, lace wing flies, and the larvae of midges, control them, but the aphids possess a slight advantage over most of their natural enemies by being able to propagate at a slightly lower temperature, and, in certain years—like the present—gain quite a start before they are overtaken and controlled—a sufficient start to cause quite a lot of annoyance in the way of dripping "honey dew."

### "Honey Dew" Explained.

To make the matter of "honey dew" perfectly plain, the aphid which is a minute, usually pale green insect, rarely ever attaining the length of one-quarter of an inch, derives its living by sucking the juices from the leaves—only a very small amount of the juice or sap that is pumped from the leaves is utilized by the aphid; in fact, only the salts are used for nourishment. In order to get sufficient of this material an enormous amount of sap must be taken. After the salts are extracted the residue is pumped through two little spouts in the back of the abdomen. This excretion is sweet and sticky, known as "honey dew" and is readily devoured by the ants. This is the way the "honey dew" is produced, and is not by the tree "bleeding," as is generally supposed.

The relationship between aphids and ants has often been described and is one of the most fascinating topics in the whole field of nature study.

### Ants Preserve Them.

The "honey dew" is greatly enjoyed by the ants, which in a surprisingly intelligent way care for the aphids, carry them bodily to better feeding grounds, recognize the necessity for migration and at times assist in these migrations and actually prepare locations in advance of transporation. The term which is often applied to aphids as "the milch cows of the ants" is very appropriate.

Probably the most interesting feature of this insect is in regard to its development, the peculiar phenomenon known as parthenogenesis, which means the virgin birth, i. e., the birth of individuals from a virgin female, and the fact that with most species and during a large part of the year, the young are born alive, and the early age at which offspring begin themselves to reproduce—simply a matter of days—accounts for their extreme prolificacy.

As to their control: Early in the spring there are but a very few scattering individuals of the pest. By propagating their natural enemies artificially, or holding them over in the adult stage in cold storage, so as to liberate them against the pest at this stage, is the proper manner in which to combat the pest. The lady bug will prevent the aphids from becoming sufficiently numerous to be troublesome and will prevent the dripping of "honey dew," yet enough aphids will remain on the trees to feed the lady bugs and perpetuate their species, thus restoring the natural condition, known as the equilibrium of nature. By the introduction of quantities of lady bugs at the present time the annoyance can be minimized for this season. In this case, as in others, prevention is the true solution, and this can be accomplished by the introduction of lady bugs at the proper time, thus destroying the producers of "honeydew."

### Sparrows Are Enemies.

Sparrows are certainly a disadvantage to the lady bugs. In this city undoubtedly they destroy quite a number of the larvae, or young. On the other hand, I have repeatedly observed sparrows on many occasions eagerly devouring the aphids and passing the larvae of the lady bugs by. With such a bounteous supply of food in the shape of aphids, I believe their destructiveness to the lady bugs is largely offset by their equally voracious appetite for aphids.

### Are Hearty Eaters.

Many persons are under the impression that it is in the adult stage that the lady bug destroys the most aphids. While a great many are eaten in this stage, it is in the larvae or young stage, that the largest destruction of the aphids occurs. The adult lady bug deposits its eggs which are yellow in color, in little clusters on the leaves, standing them on end and in clusters of from four to a dozen, scattering them among the pest. These eggs hatch into minute crawling cigar-shaped larvae and feed and grow to the length of nearly a half inch. From this they pass into a quiescent stage, known as the pupae, fastened by the posterior portion of the body to the leaf. This gradually bursts open and the molted skin remains on the leaf and the lady bug issues as an adult. About twenty days is the average life cycle from egg to maturity, and each female lays about 125 to 150 eggs. It will be seen from this that their reproductive powers are enormous.

### Value of "Bug vs. Bug."

This work of preventing outbreaks of pests in the commercial orchards is the real work of the State Insectary. These friendly insects, colonies of which are daily sent out to the commercial orchards, may in reality be compared to a system of "firemen." It is in preventing loss that their real value lies. They work unseen and their worth is not known or appreciated until a condition arises like the present, which shows what will and does happen when their presence and influence is removed.
—E. K. Karnes in Sacramento Union.

# Live Stock and Dairy

By Mrs. Minna E. Sherman

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

## TATTLINGS.

THE beauty of the dairy cow was not considered as after all of much account until within the last ten years. Now beauty is known to mean perfection. If we were all perfect physically as human beings we would be beautiful. Now in the human family other qualities of mind and soul attract rather than mere physical points and beauty is not reproduced. After all I never saw a woman of great beauty of form and feature who was not of the cow like type, that calm tranquility that goes with overpowering beauty and gives rise to the idea that beauty and brains do not go together.

### Dairy Marks.

A few years ago one dairy authority gathered together the forms of the great producing cows of his state and concluded that the high pelvic arch was one mark. This point was bred for, until the tails of the cows were hung on at an angle that was really the reproduction of an accidental deformity. Dr. Haring of the University told me that he had tuberculin tested cows that were so badly deformed that it was difficult to take their temperatures. Another fad was to consider that any part of the cow that did not directly belong to the milking or manufacturing portion was useless. The broad chest and deep heart girth as well as the large stomach were cut down and the cow was reduced to a wedge shape with the front of the wedge narrow to the point of contracted lungs and cramped heart. Then another wedge shape was put on her to take out the little breadth she had left by making her wedge shaped on top or as one looked down on her. Fortunately this idea has passed and it is recognized that a cow must have room for the functions of her body to be carried on within her frame in a vigorous manner and that she must have a good digestion and a large stomach to carry plenty of food.

Now to go back to that raised hump at the tail, how could the enlargement of a vertebra of the spine into a deformity of bony tissue up on the top of a cow's back increase the milk yield? The hump farther forward on the draft horse has not been considered as a mark of great strength. The strongest pulling mare I ever owned had this lump, but I never considered that it helped her pull a load any better and it certainly did not add to her beauty. The great and almost perfect legs, loins and shoulder muscles of this mare and the intelligence with which she slowly threw the weight of her 1900 pounds against the collar while her feet gripped the ground with bent knees started the load slowly into motion.

### Educate the Eye.

These irregularities must be bred out of the horses and cows alike. The deformity of the tail in cows in the state referred to before, probably sprang from one or two cows that had proven particularly good and whose sons were used extensively as sires to improve the country stock. They were successful transmitters of both deformities and performing ability. Educate the eye for beauty and breed to style in the herd. The dairy herd should reflect the master's mind and grow into a type of its own by his successful blending of the various animals.

### Varied Foods.

Surroundings and similar foods make in time for likeness in animals. While the cows are sometimes far from their native habits, it is well not to make them too artificial. The bovine is a browsing animal as well as a grazing one and a little rough feed is relished. I often watch the cows eat the leaves and twigs off the branches of either willow or poplar trees that break off in the pastures. A large cottonwood limb fell this morning and in a few minutes the cows had left the alfalfa and were crowding around reaching over after the leaves like a lot of children. In an hour it had been cleaned off down to the large limbs. The cows needed that browsing rougher food and will be better for it. Corn stalks have a feeding value in this way greater than their actual available nutriment, but they must be used only in moderate quantities as a helper out of the richer foods. Alfalfa is the main standby in the dairy. It has largely taken the place of bran. It will always be the source of protein; and when we have selected the corn a little longer for California conditions we will double our crops. In ordinary years ten tons to the acre is a yield that is cheaply gained from the cornfield, while with a little cultivation and fertilization twenty tons can be had fully as readily from each acre to fill the waiting silos.

### Bran.

The high prices of all the by-products, as bran, have grown with the increased use of breakfast foods. The foods our fathers fed their cattle have become the diet of our children. This will drive the dairyman more and more to alfalfa and corn as his best feeds, ones that he can grow at home and that cannot be cornered in price as wheat has been, before it reaches the cow's stomach At present it looks as though butter fat were being cornered by the trust creameries, and the Farmers Union is making an effort to stop it by making pools of butter fat among the dairymen. While we hope great things from this movement, still we have been in several raisin associations, always to hold the umbrella and to receive less personally for our raisin crop than when we went it alone and sold for what we could get the commercial packer to pay us for the goods. The horses on the ranch are growing fat on raisin diet this year, and the cows will have a few in their grain though they cannot be fed on raisins exclusively. The horses on the back of the ranch, five in number, have been on raisins alone for two months and are fat and thrifty. So

Do your cows milk hard? Send 50 cents for tent expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

**Wood Soled Boots and Shoes**

**Creamerymen, Milkers and Farmers**

Write us for prices and descriptive circular of our line of wood soled boots and shoes. We carry the very best goods made in this line. The uppers are made of the best quality of Milwaukee oil grain leather. The soles are well shaped, comfortable, and fit as well as all leather boots or shoes.

We all know wood is a non-conductor, consequently it is much drier and a great deal warmer in winter. They are lighter than Rubber or Leather Shoes and Boots. Shoes, $2.00; Boots, $3.25. The wood sole boots are an absolute safeguard against rheumatism as they keep the feet dry both summer and winter.

it is well to reverse the rule of the old farmer, "Feed the best and sell the rest." The rest is hard green peaches now going East, while wholesome raisins are going to the barn and pig pens.—M. E. Sherman.

## THE LOCO DISEASE OF LIVE STOCK IN THE WEST.

The so-called loco disease of horses, sheep, and cattle has been for many years a source of serious loss to stockmen in the West, who have generally attributed it to certain weeds eaten by the stock. Investigations by the United States Department of Agriculture have not only confirmed the supposition as to the poisonous effect of these plants, but have resulted in the discovery and identification of barium as a definite poisonous element in them. Feeding experiments establishing the fact that the plants are responsible for the disease were carried on under field and corral conditions by Dr. C. Dwight Marsh, while the discovery of barium was made in the laboratory by Dr. A. C. Crawford.

The loco weeds are a class of leguminous plants of which the principal ones are the purple loco weed (Astragalus mollissimus) and the rattleweed (Aragallus lamberti). One or both of these prevail to a greater or less extent over an area including all or parts of Montana, Wyoming, North Dakota, South Dakota, Minnesota, Nebraska, Kansas, Colorado, Utah, Arizona, New Mexico, Texas, and Oklahoma.

The characteristic symptoms of the disease are a slow, staggering gait, rough coat, staring, vacant look, and emaciation. The affected animals have hallucinations, can not be led or backed, show more or less lack of muscular co-ordination, gradually lose flesh, and die. The affection comes on in a slow and cumulative manner, and there is no possibility of animals becoming immune by continually eating the plants.

The proverb "An ounce of prevention is worth a pound of cure" applies to this disorder. Although good results can often be obtained by the treatment of locoed animals, the most effective way of dealing with the trouble is to keep animals from eating the loco plants. Wherever practicable the weeds should be exterminated from the range or pasture, and the best way of doing this is simply to cut them out. This method, however, while often practicable on land under private control, can not very well be applied to the public range. In many cases much can be accomplished by keeping animals away from loco-covered ranges during the time when feed is short, as they are much more likely to contract the habit at such a time. It may sometimes be profitable to feed them for a short time in order that the loco-eating habit may not be formed.

After animals have become affected the first essential in their treatment is to place them where they can not eat the loco weeds. They should be given plenty of nutritious feed, and so far as practicable, feed with laxative properties, such as green alfalfa. Some may recover under this treatment without recourse to medicine. With most animals, however, recovery is hastened by medicinal treatment.

As a result of its experiments the Department of Agriculture suggests the following treatment: For cattle, strychnine in doses of three-twentieths to four-twentieths of a grain daily, administered hypodermically. For horses, Fowler's solution of arsenic in half-ounce doses daily in the drinking water or in the grain. This treatment should be continued for at least a month. To correct the constipation which is almost universal in locoed animals, magnesium sulphate (Epsom salt) may be administered as a drench in 2-ounce doses. Epsom salt may also serve to some extent as an antidote to the poison produced by the weeds. Beneficial results have also been obtained by giving horses daily a drench containing 2 ounces of Epsom salt with 10 drops of dilute sulphuric acid, and by giving cattle tri-weekly 3 to 4 ounces of Epsom salt with a proportional increase in the quantity of dilute sulphuric acid.

As the foregoing treatments are in the experimental stage, the Bureau of Animal Industry, Washington, D. C., would be glad to receive reports of results from their use.

## BRITISH EMBARGO ON AMERICAN HAY AND STRAW REMOVED.

The Department of Agriculture has received information through the Department of State that the British Board of Agriculture has removed its embargo against the landing of hay and straw in Great Britain from the States of Pennsylvania, New Jersey, New York, Maryland, and Delaware, to take effect immediately, and that the board would now have no objection to the withdrawal of any restrictions which may have been imposed on the exportation of hay or straw from the State of Michigan. The embargo referred to was declared several months ago because of the outbreak of foot-and-mouth disease among animals in Michigan, New York, Pennsylvania, and Maryland. The disease was stamped out by the Government and State authorities, and the United States quarantine was removed April 24, 1909.

---

One of the most extensive and successful swine-raisers in Kansas tells the author this: "Twenty-five years of pasturing hogs of all ages on alfalfa has proven conclusively to me that a fourth to a half grain ration, while they are on such pasture, will produce greater growth per day than when in dry lots on full feeds of corn. Hogs will maintain a reasonable growth, but not fatten much, on alfalfa pasture alone; I believe it profitable to feed them some grain while running on green alfalfa. If it is desired to full-feed hogs, they will make a rapid fattening growth from increasing the grain ration while on pasture, and with the full grain ration the meat will be nearly as firm as that of hogs kept in a dry lot, where grain alone has been fed. I find no distinction on the market between alfalfa-fed swine and those purely grain-fed, and they sell price and price alike. The general health of the alfalfa-fed hogs is equal to that of those maintained on any other feed, and they are prolific."—From Coburn's "Swine in America."

---

The Turlock creamery is now producing between 1600 and 1700 pounds of butter every day. In its busy season, however, it exceeds a ton a day.

# Irrigation and Forestry

## CONSERVATION AND REFORESTATION.

THE First National Conservation Congress of the United States has been called to convene in Seattle, Washington, August 26-27-28, 1909. Meetings are to be held in the grounds of the Alaska-Yukon-Pacific Exposition, and the management of the Congress will be under the auspices of the Washington Conservation Association.

The Conservation Congress promises to add several important chapters to the pages of conservation in the great books of American resources. Prominent among the subjects to be discussed is that of Reforestation in its relation to the general topic of Conservation, which implies a practical knowledge of how to utilize the natural resources of the country for the benefit of present and future generations.

The State of Washington is one of the largest timber producing sections of the world. The Puget Sound country—known as Western Washington—originally contained forest areas comprising 8,000,000 acres. The timber of commercial value comes from the fir, cedar and hemlock trees. Many mills have been established in various localities and approximately 3,000,000 acres have been logged-off, or shorn, of the marketable standing timber in the State of Washington alone. How to reforest those areas and thus insure permanent incomes to the lumbermen and farmers of the future, is one of the problems confronting the conservationists. On the proper solution of the question depends much of the financial prosperity of coming years.

Reforestation is one of the living questions confronting all of the American people today. When a marketable tree is cut away from the forest it represents the growth of centuries. It cannot be replaced in a day, and in some cases cannot be renewed within a generation of the human family. In many instances the marketable trees occupy positions of more than ordinary importance. They hold the key to the secret of the maintenance of watersheds and reservoirs of moisture that supply the valleys below with water for domestic and irrigation purposes.

The cutting away of the trees in such instances results disastrously to the water supply needed for driving the wheels of machinery supplying the homes with one of the necessities of life and furnishing to the soil that which it must have in order to produce satisfactory crops.

The conservation movement is intended to take the initiative in preserving and protecting all of the natural resources of our country. The forests, forming the foundation of so much wealth and prosperity, are naturally the first to be considered. To properly reforest the denuded districts will demand the attention of the combined forces of State and Nation. One man alone cannot do much in reforestation because of the necessity for co-operation if forest fires and general waste are to be prevented.

The time has come when all should be interested in the subject of reforestation. Men should be encouraged in every legitimate way to plant and cultivate forests. It is a part of the legitimate work of the farmer and of the land owner.

In China the man who plants a tree for future use is considered a philanthropist and is honored for his work. Such should be the case in every section of the United States.

Object lessons showing the results of wasteful methods in logging and lumbering are noticeable in every section of the country where forests formerly adorned the hills and mountains.

A few years ago the people of Ohio and Kentucky cut away the native walnut trees and peddled the logs at local sawmills for merely nominal figures. Today they are digging up the roots and selling them for more than the original trunks brought a quarter of a century ago. Sawmills are being displaced by veneering plants that utilize the second growth saplings for making a substitute for hardwood furniture.

The conservationist has something to do now in working for a change in the system of handling the forests. The time has come when prompt action is necessary in order to insure a continuation of the sources of raw materials for the future, and without endangering the legitimate industries of the present.—Joel Shomaker, Chairman, Washington State Conservation Commission.

## MANURING THE GARDEN.

MANURE from the cow stable is mild and may safely he used on the garden either fresh or well rotted. Manure from the horse stahle is very strong, quickly heats and should be spread very thinly upon the plowed or spaded soil. If used in large amounts immediately before planting it is liahle to heat and dry out the soil and burn the roots of the plants, causing them to die. Sheep manure is also very rich, but it does not readily heat and may be safely used under almost all conditions. A little of it will go a long way. Hog manure is also a splendid garden fertilizer.

Poultry droppings are the richest and best of all garden fertilizers. They are very concentrated and contain a large proportion of mineral matter, hence they should be used in connection with milder manures that contain an excess of organic matter. Coal ashes are often sprinkled on the droppings in the poultry house to keep down foul odors. In doing this, the ashes ahsorb rich portions of the droppings, which makes them more valuable for use. The coal ashes have no particular fertilizing value in themselves, yet they help to lighten heavy soils and make all soils more retentive of moisture. The mixture of poultry droppings and coal ashes makes a safe and valuable garden fertilizer.

Another good way to use poultry droppings is to mix them with cow manure. The droppings are strong and cow manure weak, hence the mixture supplies a well-balanced plant food. A good plan in handling them is to clean out the henhouse and cow stahles daily, throw the cleanings together in a heap and haul and spread them on the garden as time permits. It is also a good plan to pile together in the same heap and mix well together all kinds of manure and organic refuse. With them may he mixed commercial fertilizer—lime, rock phosphate, hone meal and others. Commercial fertilizers, being concentrated, nearly always give best results when used in connection with stahle manure containing a liberal proportion of litter. Coal ashes and ground rock phosphate may he used in the stable as an ahsorher of liquid manure, and thus be made to serve a douhle purpose. Wood ashes should never he used on poultry droppings or as an ahsorber of liquids in the stahle, as they contain active chemicals which liberate nitrogen compounds of the manure and allow them to escape and hecome lost in the air. Wood ashes are a splendid garden fertilizer, containing valuahle potash and lime, yet they should be used only as a top dressing immediately preceding planting of crops. Wood ashes are very soluhle in water and if applied to the soil at any other time or in other manner, their richness is dissolved out by rains and much of it hecomes lost.

## CUCUMBER SEED.

In answer to a Cultivator subscriber who has a couple of acres in cucnmbers and wishes to know how to screen the seed. Mr. Lobingier sends the following:

Give good clean cultivation and abundance of water until the cucumbers have about fully developed when you can allow them to ripen up, withholding water and cultivation. For that area, you can make a hand press of the crudest kind that will enahle you to squeeze out the seeds very rapidly.

We used a common trestle such as carpenters use, upon which we mounted a hox that was ahout 8 hy 10 inches and 6 or 7 inches deep with a hole on the side about 1½ by 2½ inches for the seeds and pulp to pass through and drop into a tub that should set underneath the trestle. An upright piece ahout 20 inches long was fastened to the trestle near one end and a lever fitted into it and fastened with a one half inch holt, and a piece of 3 hy 4 about a foot long was securely fastened to the lever directly over the hox. The seed were pressed out one at a time by raising the lever up high enough to drop a cucumber into the box and then pressing the lever down, after which the lever was again raised and with the left hand the broken cucumber was tossed out on a pile, and the seed. would slide into the tuh.

The cucumbers must be ripe enough to mash easily, but not decayed. As the pulp is very slippery at that stage almost every seed will be pressed out.

When the tub is full, the seeds with the pulp, must he transferred to a barrel and allowed to ferment, when the seeds will separate readily from the pulp and hy washing through a couple of waters and running through a sieve, will come out perfectly clean.

Care must be had to make the barrels only half full at first as in the process of fermentation the mass expands like yeast and if made full the seeds would run over and he spoiled. After fermentation goes down two or more can he put into one and save space.

The harrels can stand out in the open if necessary with only a sack thrown over the top until they are washed. The drying should he done in the shade on shelves of hurlap and the seed spread upon the burlap not deeper than two inches and stirred with a hoe a couple of times per day. When partially dry it can he placed deeper on the trays to save space.

We made a frame of 1 hy 3 pine, 12 feet long hy 6 feet wide and 6 feet high and nailed 1 hy 3 strips across the ends and around the sides every 15 inches and hrought hurlap 6 feet wide and stretched across for the shelves and set this frame in the barn where there was a good circulation of air but shade and it gave us a very clean hright seed. When dry it was sacked and suspended to the cross heam in the harn where it kept perfectly until sold.

The method of pressing out the seed may seem tedious and slow but I once pressed out the product of six acres in less than ten days with two men and two hoys. We hauled the cucumhers in large piles at convenient stations in the field and made a platform beside each press so that the man working it could reach a cucumher with his left hand without stooping—using his right hand to work the press, and it was surprising how rapidly it was done. The hoy kept the platform filled with cucumbers and transferred the seed from the tubs to the barrels. When one pile was used up the fixtures were moved to the next pile. We found it an advantage to nail a piece of hoard on the hottom of the press that was ahout an inch larger all around than the bottom of the 3 hy 4. This gave a larger surface to bear down on the cucumber.—Q A. L.

**Eucalyptus Seeds**

In large or small quantities. 33 kinds to select from. Write for free pamphlet "Eucalyptus Culture." It gives full directions for sowing the seed, raising the plants and planting out into the field, together with descriptions of all the leading species, giving their uses and the localities to which they are adapted. Sample packets 15c each, 2 for 25c, 4 for 50c, 9 for $1.00. Choice Flower, Garden, Tree and Palm Seeds, Roses, Flowering Plants etc. Catalogue mailed free upon application.

# The Ornamental Garden

## GLADIOLUS AS A MONEY CROP.

I BELIEVE that the best opportunity at present for a money crop in the way of flowers that can be grown by the average gardener without special experience in florist work is in the growing of gladioli flowers and bulbs for sale.

It is especially suited for the woman who wants to grow something for a side line—something she can grow in her own garden without expensive preparation and without professional knowledge.

The gladiolus is probably the most easily grown flower known, and I consider it one of the most beautiful. It will grow and bloom in any kind of common soil. It needs no more care than onions or potatoes; and in fact, it should be handled in much the same way.

It has all the colors of the rainbow, has good size, and will keep for two weeks after it is cut. What other flower could do this? They are growing in popularity, and are in great demand by flower lovers everywhere.

Now, about the commercial side of it. I can tell you best about this by quoting some from a delightful letter received from an old man in Ohio who has made a fine success in selling his flowers. He is a blacksmith living in a little country town in Central Ohio. Here is his description of his garden:

"My lot is five rods wide and ten rods long, and fully half of it is occupied by house, shop, woodhouse, stable, henhouse, dooryard, chicken yard and fruit trees. I have ten Bradshaw plums, eight Kieffer pears and nine cherry trees all bearing, besides six dwarf apple trees, six budded lilacs, also beds of larkspur, phlox and over one hundred clumps of peonies and candidum lilies.

"This I tell you so you can see my lot is not all in gladioli. I have been growing them for twenty years; but for many years, I just cut good blooms and let them go to waste, because I did not know they could be sold. I carried many an arm load through our little village of 600 persons, giving them to this one and to that one, and sometimes finding a liberal-hearted fellow who would give me a quarter in return.

"One day a man visited across the street, and I gave the lady a small bunch to put on her table. This man was the landlord of a hotel in Richmond, Indiana, and had never seen or heard of gladioli before. After dinner he came across the street with the flowers in his hand. I was busy nailing on a shoe when he came around and wanted to know if I was the party who 'growed these flowers.' I told him 'Yes,' and he said, 'You had better quit shoeing horses and go to growing flowers;' and he told me to ship him fifty spikes twice each week by express, and make my own price, for he must have them to put on the table.

"This was the beginning of my first sales, and it amounted to some $10 or $12 to me that season. At that time it was almost impossible to sell any in this little town; but this year I sold sometimes as much as $3.75 in one day; so you can see you can educate the people to buy flowers, if you have something fine.

"For shipping I use a square box or crate made out of three-eighths lumber which is light and strong. This box is open at the top and has a deep, slender tin can in each corner holding water. I set a bunch of flowers in each one of these cans, packing the stems in as tight as they will fit. I mark the crates to be returned to me when empty. When the spikes are large, it will take twelve or thirteen to a can, but later on, when the spikes are smaller, you can get as high as seventeen to twenty in a bunch. I ship in the evening, and they reach their destination about 9:00 a.m. the next day, and I pay 75c per hundred express rate.

"I have possibly three-fifths of my garden in gladioli, and I have netted so far this year (July 22) $113.16 for cut blooms, and there are many in the garden yet to bloom—possibly one-third, yes, fully this much. They have been netting me 4c each, or $4 per hundred. I made my first shipment July 2. Try cutting gladioli when first flower or two opens and put them in water in upright position and set in a cool, dark cellar for thirty-six or forty-eight hours before you ship them."

Now, I have told you exactly what this man tells me about his flowers, and you can see for yourself what he is doing. Any woman with a good garden could do fully as well, and it would certainly make a nice lot of pocket money, to say nothing of the enjoyment and satisfaction to be had from it.

Now, besides the cut blooms, the bulbs are a valuable crop. I paid this man over $150 last year for his surplus bulbs, as I wanted them to add to my own collection. Of course, he has a fine strain of flowers, but probably no better than other really first-class strains.

Now, I do not say that everyone could do this well, but there are hundreds of people who could, and for a flower lover, it would be pleasant work.

The bulblets should be planted thick in rows a foot apart, and tended just as you would tend onions from seed, except that they should be planted deeper than you would plant onion seed. They should go probably about two inches deep.

The big bulbs should be planted about four inches deep and the rows should be about two feet apart, so you can walk between them nicely when they are in bloom. We put the bulbs generally about three inches apart in the row. Each big bulb will make from one to three spikes of bloom, averaging probably a little better than two spikes to a bulb. In the fall at digging time, you will find as many new bulbs as there were spikes of bloom, and besides, you will get anywhere from half a dozen to a hundred little bulblets, so you see that they will increase quite rapidly. Even with the big bulbs alone, you will more than double your stock each year, and with the increase of the little bulblets, you can soon work up a big stock.—St. Jo. Fruit Grower.

---

The following plants will flourish on the shady side of the house : Ferns, pansies, sweet-alyssum, wandering-jew, mignonette, torenias, forget-me-nots, primroses, mimulas, begonias, fuchsias, heliotropes, plumbagoes, and godetias.

The 31 Year Old **SUCCESS SPREADER** Roller Bearing

Free From Cog Gears—Direct Chain Drive—Light Draft—Choice of Everybody Who Really Knows Manure Spreaders.

Why experiment? The Success is in use at nearly all Agricultural Colleges and U. S. Experimental Farms. It makes you sure of right work and right working. Parts simple—everything direct—free from breakage—long lived. A generation of experience in it—it has been the leader from the first. Distinguished features made exclusive through patents.

### FARMERS' INSTITUTES.

Farmers' Institutes for Southern California have been arranged by Mr. J. B. Neff to be held in San Diego county as follows: La Mesa, Aug. 23-24; Chula Vista, Aug. 25; Escondido, Aug. 26-27; Capistrano, Aug. 28. Talent from the State University will assist local people in making up good programs at these institutes.

### FUMIGATING TENTS.

As will be seen in the article at the bottom of the first page of this week's issue, there is an effort being made to prevent fumigators from using the Morrill system which has been prepared by Messrs. Woglum and Maskew, illustrated and described in the Cultivator about a year ago. The party who has the patent maintains that it covers the Woglum, or as it is more generally called, the Morrill system. A communication from Mr. Woglum, who is in charge of the field experiments in California, indicates that competent judges have passed upon the matter, and it is perfectly safe for citrus growers to use this system of measuring the cubic contents of tents after they are drawn over the trees. It would certainly be a great misfortune to the industry were this not the case, for this system has proved most satisfactory and has made the percentage of successful work vastly greater.

Since the very first, fumigation has travelled a hard road. Old timers in California remember that years ago when it was first suggested, there was a continual fight for a few years with those who claimed patents on the process. It has so far been absolutely in charge of the orchardists and we trust that with its improvements it will remain so.

### MUNICIPAL FORESTS.

In the issue of July 29th we referred on this page to possible income of cities from forests maintained similarly to the municipal forests of Germany. Since then we notice that a few cities of the New England states are taking up the matter and planting forest trees over water sheds which control the water supply for their domestic systems. More recently the Pennsylvania state legislature has passed an act permitting cities to acquire municipal forests, and some of these cities are buying waste lands at the sources of their water supply. These lands will be planted, and as the trees come to maturity they will be intelligently disposed of to lumber dealers. The Pennsylvania act contemplates the issuance of bonds by the municipalities to raise funds for the acquisition of such lands and maintainance for the first few years. Before such lands are purchased, permission must be obtained from the state commission of forestry which makes subsequent provision for their administration.

If this matter has interest for Eastern municipalities, it has for those of the Pacific Coast, and especially to anyone connected with agricultural industry.

### GRAPE INVESTIGATIONS.

The investigations which have been conducted by G. Harold Powell and his corps of workers will soon be discontinued in the citrus section. The greater part of the workers will be transferred to northern and central California to grape shipping points. Mr. Powell informs us that the citrus investigations will be left in charge of one or two of his eight assistants, who will remain in the Southern California lemon houses the year through. The others w go to Lodi and from there will be directed a campaign of grape investigations which it is hoped will succeed in extending the grape season and increasing the field of distribution. An effort will be made, through cold storage, and the handling of the grapes on the vines to keep them later in the season. Probably the greatest difficulty in the past has been through crushing the individual grapes in the packing. This has been in part corrected by Mr. Powell's investigations last year. He finds that the Lodi grape growers are entering heartily into this work and aiding him in every way possible.

### AN EFFICIENT WORKER RETIRED.

We have information that Dr. R. H. Loughridge, for many years Professor of Physics and Chemistry of Soils in the State University, has been made Emeritus Professor of Agricultural Chemistry. If this means the retirement of Dr. Loughridge from the active work of aiding the farmers of this state and instructing the young in this most important agricultural practice, it will be learned with regret by all. Dr. Loughridge is one of those modest men, who has earned the heartiest respect of all who know him. This retirement will be directly felt, as we note that the work of examination of soils sent by farmers has been stopped, also class instruction in soil physics and soil chemistry, no one having been found to take up Dr. Loughbridge's work for this year. The readers of the Cultivator who have recently been inquiring as to possibility of soil analysis at the State University should bear this in mind.

### GREEN MANURE CROP SPECIAL.

The Cultivator is already receiving material for the green manure cover crop articles which will appear in an early September number. One of the most practical observers in Southern California has just sent in a bunch of suggestions which will prove of value. We mention this now that those who have been observing the handling of cover crops in California and have items of interest, may send them in so that we may have all matter before the first of September.

### "FIRE THE JAPS."

Bakersfield recently waked up one morning to find the town plastered with placards on which was printed, "Fire the Japs." These bore the imprint of the Typographical Union of Seattle and were perhaps meant to inflame feeling against the Jap laborers who are in large numbers in Bakersfield and surrounding counties.

The Japanese question is a serious one on the Pacific Coast and needs to be discussed in a cool and sensible manner. We hope some solution will be found for it which will be fair to American labor and American producers. We do not believe a campaign similar to this at Bakersfield will succeed.

### ADVERTISING AND ADVERTISERS.

It is fair to presume that our readers are more or less interested in the advertising announcements in the paper, and there is certainly a fair amount of satisfaction in purchasing a good article at a reasonable price. How best to know what particular machine is most suited to your requirements would involve a discussion too long for our columns. Every issue contains scores of announcements concerning the latest improved farm implements, dairy supplies, gas and other engines, and in fact almost every article of practical use upon the farm or fruit ranch, in the dairy or poultry yard, or for supplying or increasing the water supply.

Suppose you want anything along any of the lines so freely advertised. You go to some particular or local dealer or manufacturer, and it is to be presumed that he will expatiate upon the special merits of his favorite machine. Perhaps his goods are all that is claimed for them, but you have no practical evidence to support your judgment except his assertion. The purchase may or may not be satisfactory. Would you not be better equipped to use good judgment in making a wise selection if, before purchasing, you had corresponded with different dealers and, by the study of booklets, catalogues and advertisements, secured a certain amount of knowledge of the merits claimed by different dealers and manufacturers? Investigate on your own account and do not take too much for granted. For this reason we recommend a careful study of the advertising columns of the paper.

### THE MARKING OF FUMIGATION TENTS.

(Continued from Page 147.)

tents, the method consisting merely of a series of concentric circular lines. The system of graduated marking of tents utilized by me in my work in this state is entirely different from the Payne method, and is protected by patent No. 902,674 issued to A. W. Morrill, a special agent of the United States Bureau of Entomology. This Morrill patent being issued to a government employee may be used by any person in the United States without payment of any royalty thereon.

After a thorough investigation of the situation, the Solicitor of Patents of the United States Department of Agriculture informed me that the patent on the government system (Morrill's) of marking tents is incontestable in any way. Therefore I would advise those people interested in fumigation to pay no heed to the contentions or threats of Mr. Payne or his agents, but continue to utilize the government system of marked tents to their fullest desire.—R. S. Woglum, Special Agent U. S. Bureau of Entomology, Whittier.

## Shop Talk

It is generally understood by our readers that subscriptions are not discontinued at expiration unless requested. We like to make the matter clear, however, so no misunderstanding can result, therefore we ask that in case of removal or for any other reason the paper is not wanted, we be notified by mail.

Our traveling representatives have positive instruction to report all such requests and it is only through error that any do not receive attention. If more than two papers come after notice is given, you may know such notice did not reach us and another postal is necessary. Only let us know your wishes and a "square deal" is assured. We are only human; some mistakes are made; requests to stop are not the orders most desired by us, but it is not our wish to force the paper upon those who do not want it.

# Agricultural Notes of the Pacific Coast

## Northern California

Nevada county has shipped its bumper crop of fresh prunes and Bartlett pears.

Some hop growers near Santa Rosa predict a price of 25 cents for this season's hops.

Arrangements are being completed for an annual fair at Eureka September 13th to 18th.

Two hundred and fifty acres of Moravian wheat at Red Bluff averaged 30 sacks per acre.

Garden peas in the neighborhood of Ferndale are being injured by an insect recently introduced.

The California state grange will hold its next annual meeting in Petaluma the first Tuesday in October.

Sonoma County Pomona grange has adopted the policy of meeting with the various subordinate granges turn about.

Prof. Major of the State University is looking for high-grade cattle, sheep and hogs for stocking the state farm at Davis.

Glenn county farmers succeeded well in the growing of chul wheat which has been sold at prices ranging near $4.50.

Scarcity of cars which proved so embarrassing a few weeks ago has been to a certain extent overcome and fruit pickers have returned to the orchards.

Swamp and overflowed land in District 609 in Sutter Co. is being resurveyed and will be included in the larger reclamation scheme.

The State Grape Growers Association is becoming more active in watching the interests of its members and is now holding meetings in many sections.

P. H. Dorsett, Chief of the Plant Introduction Gardens of the United States, has suggested the possibility of largely increasing the capacity of the government plant introduction gardens at Chico.

Levees along the Sacramento near Jacinto, Glenn county, are washing away and threatening much damage.

The injury to hops from the red spider is proving more serious than at first anticipated.

The Sacramento Valley Development Association has adopted a resolution that the sum of $50,000 a year be raised for the next five years for the purpose of advertising the resources of Northern California.

The big sugar factory at Hamilton, Glenn county, is compelled to defer opening owing to shortage of beets. It is hoped the coming season will witness the planting of at least 18,000 acres of beets in the neighborhood of this factory.

It is rumored that active work will soon begin on big reclamation schemes in Sutter and Sacramento counties. It now appears that the Natomas Consolidated which is financing the scheme will spend large sums in building immense levees.

Notices of appropriation of water, aggregating a total of 660,000 miner's inches have been filed with the county recorder of Lassen county on waters of the Honey Lake Valley. It is understood this is in the interests of the Honey Lake Land and Irrigation Co.

## Central California

Tulare has in contemplation an alfalfa meal mill.

Kerman, Fresno county, is assured a creamery in the near future.

The Kern County Fair Association will open its fall exhibition September 6th.

Modesto estimates that its output of grain this year will be a third less than last.

The Watsonville Pajaronian reports a material shortage in the apple crop this season.

An effort is being made to make this year's pack of the Pajaro Valley apples the finest ever.

Large shipments of peaches at Kerman recently exhausted the supply of tissue wrapping paper.

The farmers union has secured the use of the big packing house of the California Seeded Raisin Co. at Fresno.

Considerable wheat remains in Tulare county unsold, the holders being determined to have the top of the market.

The high price of orange nursery trees last year has induced the starting of a large number of nurseries in Tulare county.

It is estimated that San Joaquin county's hay and grain crop will increase in value over that of last year over one million dollars.

It is now estimated that the Tulare county citrus crop will be rather short. One large grower has placed it at sixty per cent of normal.

Many newcomers are finding profitable investments in Kings county, perhaps more of them entering into the dairy business than any other one line.

County Entomologist Earl Morris of Santa Clara reports that the condition of the orchards of the county is most satisfactory, though some dieback has been observed in some sections.

Many lemon orchards of the Tulare county citrus section have been re-budded to oranges, which has lowered the supply so that this year lemons for local consumption were imported.

The upper sections of the Tuolumne River and its various forks are being surveyed by the Turlock-Modesto Irrigation Company to secure information as to storage reservoir site and to make estimate of costs.

Maple Grove creamery of Hanford is finding profitable business in the manufacture of ice cream, not only for local trade but in the surrounding towns. This creamery handles much cream which is separated on the farms by hand separators. A friend of the Cultivator inspecting this plant reports that it is thoroughly up-to-date in every way.

Quoting from a Texas paper, the Visalia Times says that the paper vouches for the fact that Texas is now growing cucumbers four feet in length. The paper is honest in stating, however, that at the time the measurement was made it was without a tape line and the figures were estimated. The Times then adds that a couple of years ago it exhibited cucumbers that were "several" feet in length. We presume these must have been much longer than four feet.

## Southern California

The Valencia crop is much larger than ever before.

Barley at Perris is running 110 pounds to the sack.

The annual Grape Day of Escondido is September 9th.

A grass fire near Hemet last week destroyed much hay and grain.

The dried apricot crop of Orange county will approximate 2,000 tons this year.

Tree Warden Reed, of Riverside, is making Riverside worthy of the name "Forest City."

The cotton crop of Coachella and Imperial Valley is showing up exceptionally well.

The United States Committe on Irrigation will visit Imperial Valley September 24th.

Imperial hog raisers are asking for a packing plant which will handle their stock at home.

The grain crop in Ventura county is said to be more than sixty per cent better than last year.

The walnut crop will be a normal one, though some dropping is still manifested from blight.

An expert is handling a squirrel poisoning campaign on the Cleveland National Forest Reserve.

A Calexico nurseryman has an orange seed bed and will endeavor to raise citrus nursery stock.

Preparations are being made for Grape Day at Escondido, which is becoming a regular annual fete.

The buildings for the new creamery at Brawley are being erected and will be ready for work by October 1st.

State Forester Lull, recently visited Imperial Valley to investigate as to varieties of eucalyptus which will do best there.

The Cucamonga winery now claims the largest fermenting cellar in the world. It is of stone with 20 foot walls and is 150x400 feet.

A gentleman from San Antonio, Texas, is investigating citrus conditions in Riverside, hoping to secure information of value to Texas orange growers.

Imperial Valley is experimenting with a new hay which it is thought my be equal to alfalfa. It is Para hay, or Panicum Molle. It is reproduced by cuttings.

Prof. Shammel was tendered a banquet at Riverside last week. The Professor is about to take up the work of improvement of the orange, and it is possible will spend several years in Southern California.

The first branch of the farmers union to be organized in the Imperial Valley was in the Mesquite Lake District. The officers are: President, D. W. Tyler; vice-president, S. L. Gallagher; secretary and treasurer, John McKinney.

Cabbage growers at Fullerton who sold their crops to a shipper who afterwards refused to pay for them on the ground that he had taken them merely on consignment, sued for the amount of the purchase price. The matter passed to the Supreme Court and Appellate Court and, has finally been decided in favor of the growers and they will receive their money.

## The Coast

Eggs are now selling in Seattle at 36 cents per dozen.

North Yakima, Washington, is shipping apples to Finland.

The last shipment of cantaloupes from Arizona was made last week.

Private capital is engaging in a large irrigation project near Spokane.

Berry growers at Kenwick netted $250 per acre on strawberries this year.

Wheat growers at Dayton, Washington, averaged 55 bushels of wheat per acre.

The sugar factory at Glendale, Arizona, has practically completed its season's run.

The 17th National Irrigation Congress is in session in Spokane, Washington, this week.

Streams supplying Arizona farmers with water are running fuller than last year at this date.

The lake formed by the Roosevelt dam in Arizona is the largest body of water in the territory.

There are now 20 forest reserves in the territory of Hawaii, with a total area of $545,764 acres.

Practically all the garden vegetables in the Hawaiian Islands are grown by Chinese and Japanese.

The Ferndale Creamery Company has been incorporated at Astoria, Oregon, with $10,000 capital stock.

Dry farming operations at Ontario, Oregon, have produced the greatest crop of wheat that section has ever seen.

The Idaho State Grain Commission is in session and will fix the warehouse charges for the storage of grain.

Flour mills at Dayton, Washington, were all compelled to close until new wheat arrives owing to shortage of grain.

Pomeroy, Washington, recently shipped an entire train of 19 cars of prime steers, all intended for the Alaska market.

New Mexico is endeavoring to use prison labor in the construction of a "Camino Real" along the line of the old Santa Fe trail.

The apple crop near Sunnyside, Washington, promises to be one of exceptional quality and larger quantity than heretofore.

The earliest apples to be exhibited at the A-Y-P Exposition by any county in the State of Washington came from Benton county.

R. H. Forbes of Tucson, Secretary of the Arizona Horticultural Commission, has been making an extensive study of the citrus pests of Florida.

A large brush dam across the Tempe near Mesa City was destroyed by fire recently, causing much loss to those depending upon the stream for irrigation.

Asotin county, Washington, created a sensation at the A-Y-P Exposition by exhibiting a seven tier box of cherries which were pronounced the finest ever exhibited.

The country in the neighborhood of Pullman, Washington, was given a two and a half inch rainstorm within 36 hours, which is the heaviest ever recorded at this time of the year. It did great injury to grain fields.

# Profit in the Poultry Yard

By Mrs. Frank Metcalf

**We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.**

### TRAP NESTS.

IN ALL the experimental work with laying hens at the Maine station use is made of trap nests. During the past year a new type of trap nest has been devised which is proving extremely satisfactory. The features in which this nest is superior to the type formerly used at the station are (1) certainty and precision of operation; (2) greater simplicity of construction, with less tendency to get out of order and work badly; (3) saving of labor in resetting the nest after use.

The nest is a box-like structure, without front, end, or cover, 28 inches long, 13 inches wide, and 16 inches deep, inside measure. A division board with a circular opening 7½ inches in diameter is placed across the box 12 inches from the rear end and 15 inches from the front end. Instead of having the partition between the two parts of the nest made with a circular hole, it is possible to have simply a straight board partition extending up 6 inches from the bottom, as shown in figure 8. The rear section is the nest proper.

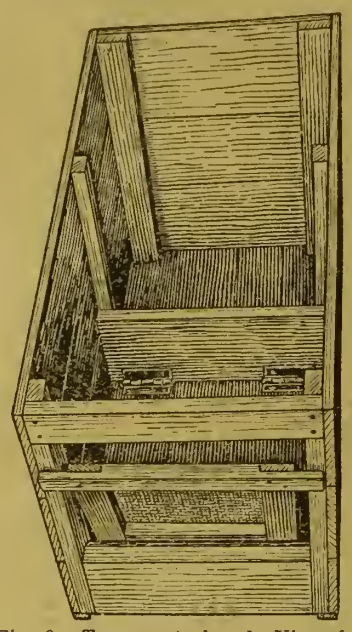

Fig. 8.—Trap nest closed. View from above.

The front portion of the nest has no fixed bottom. Instead there is a movable bottom or treadle which is hinged at the back end (fig 8). To this treadle is hinged the door of the nest. The treadle is made of ½-inch pine stuff, with 1½-inch hardwood cleats at each end (figs. 9 and 10) to hold the screws which fasten the hinges. It is 12 inches wide and 12¼ inches long. Across its upper face just behind the hinges holding the door is nailed a pine strip 4 inches wide, beveled on both sides, as shown in figures 9 and 10. The door of the nest is not made solid, but is an open frame (figs. 8 and 10), to the inner side of which is fastened (with staples) a rectangular piece of ⅛-inch mesh galvanized screening (dimensions 8 by 9 inches). The sides of the door are strips of ¾-inch beech stuff 12 inches long and 1½ inches wide, halved at the ends to join to the top and bottom of the door. The top of the door is a strip of hardwood 13 inches long and 1½ inches wide, halved in 2¾ inches from each end. The projecting ends of this top strip serve as stops for the door when it closes (fig. 8). The bottom of the door is a hardwood strip 10¼ inches by 4 inches. The side strips are fitted into the ends of this bottom strip in such way as to project slightly (about 1-32 inch) above the front surface of that strip, for a reason which will be apparent.

When the nest is open the door extends horizontally in front, as shown in figure 9. In this position the side strips of the door rest on a strip of beech 1½ inches wide, beveled on the inner corner, which extends across the front of the nest. This beech strip is nailed to the top of a board 4 inches wide, which forms the front of the nest box proper. To the bottom of this is nailed a strip 2 inches wide, into which are set two 4-inch spikes from which the heads have been cut (compare fig. 9). The treadle rests on these spikes when the nest is closed. The hinges used in fastening the treadle and door are narrow 3-inch galvanized butts with brass pins, made to work very easily. It is necessary to use hinges which will not rust.

The manner in which the nest operates will be clear from an examination of figures 9 and 10, which show a sample nest with one side removed to show the inside. A hen about to lay steps up on the door and walks in toward the dark back of the nest. When she passes the point where the door is hinged to the treadle her weight on the treadle causes it to drop. This at the same time pulls the door up behind her, as shown in figure 10. It is then impossible for the hen to get out of the nest till the attendant lifts door and treadle and resets it. It will be seen that the nest is extremely simple. It has no locks or triggers to get out of order. Yet by proper balancing of door and treadle it can be so delicately adjusted that a weight of less than half a pound on the treadle will spring the trap. All bear-

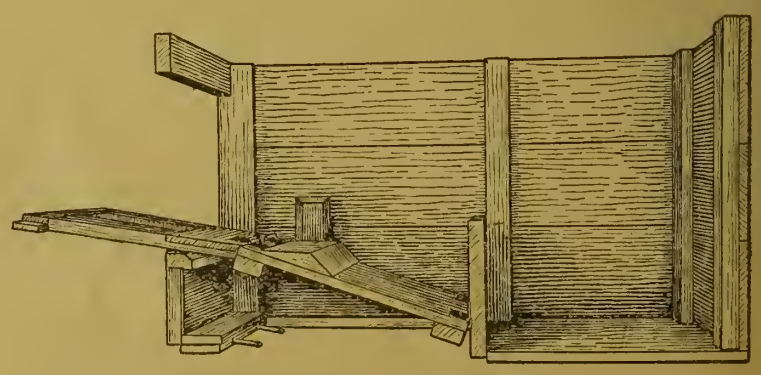

Fig 9.—Trap nest open. One side removed to show method of operation.

ing surfaces are made of beech because of the well-known property of this wood to take on a highly polished surface with wear. The nests in use at the Maine station have the doors of hardwood, in order to get greater durability. Where trap nests are constantly in use, flimsy construction is not economical in the long run. For temporary use the nest door could be constructed of soft wood.

The trap nests are not made with covers because they are used in tiers and slide in and out like drawers. They can be carried away for cleaning when necessary. Four nests in a pen accommodate twenty hens, by the attendant going through the pens once an hour, or a little oftener, during that part of the day when the hens are busiest. Earlier and later in the day his visits are not so frequest. The hens must all have leg bands in order to identify them; a number of different kinds are on the market. The double box with the nest in the rear is necessary. When a hen has laid an egg and desires to leave the nest, she steps out into the front space and remains there until she is released. With only one section she would be likely to crush her egg by stepping upon it, and thus learn the pernicious habit of egg eating.

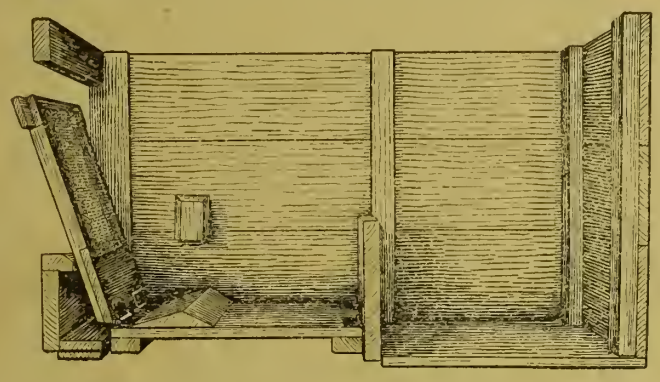

Fig. 10.—Trap nest closed. One side removed to show method of operation.

To remove a hen, the nest is pulled part way out, and as it has no cover she is readily caught, the number on her leg band is noted and the proper entry made on the record sheet. After having been taken off a few times the hens do not object to being handled, most of them remaining quiet, apparently expecting to be picked up.

Before commencing the use of trap nests it was thought that some hens might be irritated by the trapping operation and object to the noise incident to it, but such does not seem to be the case. Trap nests have been used at the Maine station for Leghorns, Brahmas, Wyandottes, and Plymouth Rocks.

The amount of time required in caring for the trap nests can only be estimated, since the attendant's time is divided with other duties. The time varies from one day to another and with the number of nests in use. By noting the total time used each day in caring for the nests when the hens were laying most heavily, it has been estimated that one active person devoting his entire time to trap nests could take care of 400 to 500 nests used by 2000 to 2500 hens. When commencing the year's work he would need assistance in banding the birds, but after that was done he could care for the nests without assistance until midsummer, when the egg yields yould probably be diminished and a part of his time could be spared for other duties—U. S. Bulletin 357.

Don't blame the hens if they are not laying. Place the blame where it belongs, on the one who has the care of them.

## TRAP NESTS AND EGG PRODUCTION.

So much has been written relative to the use of trap nests and the results obtained therefrom, that it has led to the belief that the growing of hens that lay 200 eggs or more in a year is the result of the use of trap nests. Trap nests are valuable for supplying records. They lead to the selection of the hens that lay the eggs; they tell to a certainty just what hen lays each egg, and records of this kind are valuable to those who are building up an egg-producing strain.

There is no other way whereby the poultryman can tell to an absolute certainty just which hen lays the eggs and how many eggs each hen lays in a year. The use of the trap nest has led to the discovery that many hens never lay at all and that other hens lay more eggs in a year than was formerly thought to be possible.

The use of the trap nest has led some to indulge in tales of fancy egg production that is beyond the possibility of hen to accomplish. Several years ago Professor Gowell of the experiment station in Maine published a list of records of laying hens that astonished the world. The writer was always skeptical relative to these statements, believing that a mistake had occurred. We were in nowise backward in stating our opinion relative to these records in personal conversation with Professor Gowell. In the record issued by the Maine experimental station in March the following statements were made:

"The daughters of '200-egg' hens were in this experiment very much inferior to their mothers in average egg production. This is peculiarly true of winter egg production. Daughters of 200-egg hens are not such high egg producers as pullets whose mothers' egg record fell in the 150 or 200-egg class. The daughters of 200-egg hens were most inferior (proportionately) to the unregistered pullets in respect to winter egg production."

These statements lead to the conclusion that there is no certainty that pullets from heavy egg producers will be equal to their mothers in egg production. Hence belief that the production of an unusual number of eggs from a given number of hens is more the result of care and feeding than of breeding. There are strains of poultry that produce few eggs. Egg production can be improved by cultivation. There is evidence that the breeding from egg producers does not insure equal production in the offspring.

We have stated before that we doubted the possibility of hens producing 250 eggs in a year. Hens that produce 250 eggs in a year must extract over 50 ounces of pure albumen from their food. A careful calculation of the quantity of this in 100 pounds of grain, which is about the yearly ration for a hen, will tell whether there is this amount of that element in the food. Something cannot come from nothing. As the average hens are fed, it would be quite difficult for them to manufacture 280 eggs in a year out of 110 pounds of the average grain.—Country Gentleman.

**A MILLION CHICKS 10c**

and up, is what we will sell between now and next July. Our NEXT BIG HATCH will be due SEPTEMBER 6th, order now if you wish to get the low prices on chicks as listed in our chick book. Chicks will positively be raised in price on all kinds in the fall when eggs get high. Contract now for them, and pay a small deposit on them, just send for chick book and full particulars today. We hatch 17 kinds of chicks, ducks, geese, turkeys, etc., in season. We are

**Coulson's**

**EGG FOOD**

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

For sale by dealers everywhere. Write for our free book "Poultry Feeding for Profit" with samples of our Poultry Food.

# Bees and Their Care

By Henry E. Horn, Riverside

### REQUEENING.

I WAS asked recently if it was sufficiently beneficial to re-queen and when to do it.

It is, without doubt, beneficial to improve one's stock; to supplant an old queen with a young one or to re-queen to prevent swarming.

To re-queen for improving the stock, any time is good. Perhaps the best is when the honey harvest is over; queens can be had generally cheaper then, and the colonies need not be disturbed before the harvest.

Any time it is found that a queen does not do good work, she should be killed and a young, vigorous one introduced; but I do not wait for this. In my yards I requeen every second year and if I were running for section honey instead of extracted, I would do it every year. I am thereby not only sure that strong, young queens are in all the colonies but as I do the re-queening before the swarming time, that nuisance is prevented to a great degree also.

For this purpose only queens reared the present year can be considered, as colonies in which queens one year or older are introduced would swarm anyhow, just as if no re-queening was done. For latter purposes the colonies should be kept from swarming until nearly at the opening of the flow, from which the surplus is expected by giving them an extra brood chamber for brood rearing. Then about a week before the honey flow opens the old queen should be replaced by a young one. When the flow opens, one story must be taken away, the other with the young queen left on the old stand, and the brood nest arranged, then queen excluder and supers put on; and the bee keeper can now be quite confident that the bees will do the best work in honey gathering with little danger of swarming.

If the bee keeper works toward non-swarming and he succeeds, he will very materially increase his honey crop. For this purpose I know of no single thing better than the re-queening of all the colonies with young queens just before the harvest.

These removed queens, many of them, are in their prime, and should not be destroyed, unless they are of a breed not wanted or have developed bad qualities. Nuclei should be formed and those queens used therein. One comb containing some brood, one comb with honey and one empty comb or frame, with full sheet of foundation in a hive with perhaps a cupful of bees is sufficient. If care is taken in seeing that they have at all times feed room and protection from inclement weather they will breed up for winter and often have gathered honey enough for winter stores, also.

I do this with the 2-year-old queens I remove in re-queening. If I did not do this I would never find out all the good qualities a queen and her offspring possess, and longevity of bees is one of the characteristics a bee keeper should try to secure.

It sometimes happens that not all the colonies are ready for the super to catch a nearby honey flow; that is, they have failed to fill their hive with brood before the flow. As no honey will be secured in the sections, unless this is done, the bee keeper must take it into his own hand to correct this somehow.

One way is to take all the empty combs out of the hive and to fill the space with division boards. Another way, and one practiced quite extensively, is the uniting of two colonies to make one strong enough for super work. This is done the following way: The two colonies to be united are selected and if they do not stand alongside each other must be gradually moved until they do. The entrance of each must be contracted, say one-half. The open part of the entrance must be on the right side of the hive on the right hand and on the left side of the hive on the left hand. On the sides where the open entrances are, are the frames intended for the uniting. When the time comes to unite, the hive into which these two little colonies are to be put, a division board is put in the middle of the hive, and the entrance closed in the middle also, leaving openings on the outsides to correspond with the entrances of the two old hives. Now the combs from the right-hand hive are put into the right side, and the combs from the left-hand hive into the left side of the new hive. Now a queen excluder is put on and on top of this supers containing the sections.

The bees of each colony, being used to enter, one on the right side and the other on the left, will naturally do so in the new hive also. They will use the same super, but will not mingle in the brood apartment. To all intents they are two distinct colonies, and therefore can, when the honey flow is over, be separated again and put into two different hives to breed up and, perchance, store yet sufficient honey for winter provisions.

But for a short, heavy flow, and to do the largest work in the sections in the shortest possible time, I like best to unite the field bees of a fairly strong colony to the bees and brood of another colony. In this also, the colonies must stand close together, and it is for this uniting of strong colonies I set them always in pairs.

I select a day that honey is carried into the hive quite freely. I then quietly take off the super, if one is on, from one of the colonies. This super, bees and all, is put onto the other colony. The news superless colony is moved to another stand, and the colony, to which it is intended to unite the field bees of the removed colony, is shoved over towards where the other had stood. If the hives stood close together the remaining hive will stand one-half on the stand of the removed, and one-half on its own stand.

All the field bees from the removed colony, being used to enter their hive at the old stand will come back from the field with their loads of honey thereto, and finding the old home gone, will enter into the hive of the other colony.

In this case no fighting will take place, as loaded bees seem to be accepted in any colony. Great care must be taken to give sufficient supers at the time of uniting and to add and take off as occasion requires, otherwise no benefit will be secured. It must be remembered that work is done very fast in supers on such hives.—Pacific Homestead.

### Bees in Riverside County.

I am interested in bees and would like to learn as to whether bees pay in Riverside county. Do they make any amount of honey from alfalfa? How many pounds of honey will one colony make in one season and how much is usually paid per pound?—G. M. Gribble, Bakersfield.

Mr. Henry E. Horn of Riverside, answers: No marketable quantity of honey is made from alfalfa in Riverside county. The amount of honey produced depends upon how the bees are handled. The writer has secured a little better than 100 pounds of extracted honey per colony this season Prices to grower are about one and two cents less to the pound for extracted and comb respectively, than prices quoted in this journal.

Referring to the last paragraph in Mr. Horn's answer, we may say that the quotations given in the Cultivator each week are the wholesale San Francisco and Los Angeles quotations, which accounts for the one and two cent difference necessary for freight, commission and charges.

# General Agriculture

## ALFALFA IN CALIFORNIA.

REVIEWING conditions as they are in California S. E. Watson of Alameda, writes Hoard's Dairyman as follows:

Alfalfa seed from Chile in 1854 was the beginning of the most substantial basis of permanent success California will ever realize. The gold that the Chilenos took away in those years was poor recompense, and if we could find the grave of that miner we should see that it is always kept green with alfalfa in return for bringing the most valuable treasure of his country to one that almost duplicates it in climate. He also deserves a monument on the theory that he made countless leaves of alfalfa grow where none grew before—therefore a public benefactor.

Gov. Hoard is right in believing that the alfalfa movement is the most important agricultural event of the century. If we in California could realize this fact and appreciate its wonderful promise to the farmers of the state, there would be no doubt in our minds as to our future farm prosperity. The half century of successful alfalfa experience since its introduction has satisfied every dairy farmer here as to its value, and the hillsides of the old dairy region on the coast are losing hold on our real dairyman the foreigner, who has been a renter. The interior plains with irrigation are revolutionizing the business.

Alfalfa was a common crop in Southern California in 1874, within my knowledge, and I have seen its constant increase since that year throughout the state gradually from the sub-irrigated river bottoms to the plains and up the gentle slope toward the mountains as irrigation was developed. The little rivers of the South bring mountain soil in their annual freshets down to the plains of the coast, the great rivers of the North and interior and the countless tributaries have all provided for sub-irrigation along their course, or ditch irrigation on adjoining plains, and a thorough trial of the value of alfalfa. Every farmer in the state appreciates and canvasses the probabilities of growing it, even outside of the irrigation districts.

### Present Conditions.

The years of successful alfalfa culture along the streams of the state proved its importance as a main crop. Its possibilities under irrigation attracted speculators and in the seventies a number of companies were organized to bring the water from the headwaters of the San Joaquin, the Sacramento and tributary rivers out on the valley plains in irrigation districts. In 1871 the first great enterprise was started by Miller & Lux on the west side of the San Joaquin. They were cattle kings and land grabbers and the purpose was, first, to carry their herds through dry years by growing alfalfa; next, to sub-divide for small farming. The latter condition now exists, and dairy farms in that district bring monthly returns as high as $1,000 by sale of cream. Across the valley in the Modesto-Turlock district, supplied from the Tuolumne river, a half-million dollar dam and a net work of irrigating ditches provide water for every acre and these belong to the land and settlers, who pay the cost of service by an annual tax of under a dollar an acre for all the water they may need. Land averages $100 an acre and the soil and drainage are good. Alfalfa is the great mainstay for the live stock interests of the lower end of the valley, where dairying has become the leading one. There are three lines of railroads that carry its products to the competing Los Angeles and bay markets with river transportation to the latter. Great prominence has been given the lower valley for these reasons which brought settlement in advance of the upper valley along the Sacramento.

### The Upper Valley.

The soil for the entire valley region is similar in agricultural value and the high Sierra glaciers and snowfall insure the necessary water for irrigation from end to end. In the winter a prevailing wind from the southwest carries the rainfall over the lower coast range hills and through Golden Gate obliquely toward the upper valley and against the Sierras, depositing from fifty to one hundred inches on the mountain sides and summits, which store it congealed for future reference. On the floor of the valley the precipitation is usually about twenty to twenty-five inches in the upper, and from five to ten in the lower, end. On the coast the range is from ten to twenty inches in southern coast counties, to fifty and one hundred in the northern, and this influences the interior as the coast hills and mountains permit entrance or shut out the prevailing winter winds from the Pacific and their loads of moisture. The region along the Sacramento has, therefore, a decided advantage in rainfall, and a direct bearing in favor of alfalfa, especially in seeding and early growth.

The northern counties of Tehama, Glenn, Colusa and Yolo have been great wheat districts but the latter has shown what dairying will do with alfalfa and water. Twenty years ago a decline in wheat values and production, with dry farming, was evident and owners of large tracts got busy. An immense canal was run for twenty or thirty miles down the western side of the Sacramento, and ditches for this honeycomb the higher lands, above overflow from spring freshets. The Colusa and Glenn country is settling up with small farmers, depending on diversified crops, and alfalfa has become the most important. Land is sold from $75.00 to $100.00 an acre with water at cost of distribution.

Quality of soil does not always fix the value of land. Social conveniences usually figure and the contentment of the family is to be considered. Comfort and health are equally important and have a bearing on the selection of farm homes. These questions must be decided by everyone for himself. I have only tried to give an independent idea from observation as to alfalfa culture for dairying. From end to end of the great valley alfalfa is a success, and the market for dairy products practically equal. The extent of territory is so great that I will not try to say which point is better than another.

# Queries and Replies

**Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### Warts.

We have a cow that has great blotches of warts on her teats making it very difficult to milk her. Do you or some of your readers know of some remedy that will take them off without leaving her teats sore?—H. M., Phoenix, Arizona.

Use cold-pressed castor oil on the warts night and morning after milking. If there are some that hang by a small neck that can be clipped with sharp scissors, cut them off, one each day on each teat and touch the spot with lunar custic. More fully answered in dairy article next week. —M. E. S.

### Ropy Milk.

I have a Jersey cow that dropped her first calf when twenty months old, and her second at thirty-one, and now she is thirty-three months old; gives sixteen to seventeen pounds of milk per day; is tied on a thirty-foot chain in an oat stubble field and fed two pounds of middlings and four pounds of bran daily; looks well. Her milk after standing for thirty-six hours is ropy or slimy, but when it is fresh it seems all right. This ropiness seems to be the first or early stages of clabbering. Can you suggest a reason for this?—W. C., San Jose.

There is a great lack of succulency in this feed and the cow would be less apt to be feverish if the meal was fed wet to her. If possible add or change two pounds of the bran for two pounds of alfalfa meal. All souring or thickening of milk is caused by bacterial action. The cleanest germicide to use around milk is lime water. The vessels are rinsed in it after having been washed as usual and turned over to dry in the open air without wiping. Sunshine will always help to remove bacteria, as it is a remedy for them. If the clabbering is the natural souring of the milk, then a lower temperature will retard it somewhat. Where there is no ice, wrapping the milk jar—using a Mason jar with top as a vessel for the milk—then wrapping it in coarse canvas and putting it in an airy place with a drip arranged to keep the covering of the jar moist, will hold the temperature down several degrees. At this season of the year in San Jose the milk will naturally begin to clabber at 36 to 48 hours.—M. E. S.

### Dairy Questions.

Have a three-year-old heifer, a grade Jersey, fresh with second calf last May. What makes her breathe heavy and loud, expelling the breath with a short blowing sound—a labored breathing that reminds you of a person with asthma. Whether she runs or stands still, makes no difference, the breathing is the same. She does not seem to mind it, is in good condition and eats well. Noticed it first last winter.

Considering that she was milked right up to time of freshening, about what quantity of milk ought she now to give daily, feed consisting of alfalfa hay, wild oat hay and Kaffir corn fodder?

What can I do to prevent teats being dry and rough, the skin scaling off in little flakes when milking?

Is there any cure for a young cow that sucks her own milk?—F. E. Lindsay.

Either enlarged throat glands or else something in the nose. Foxtail bronco grass heads are often breathed into the nostrils and become embedded causing enlargements. In all cases of this kind it is safer to have the cow tuberculin tested. Often cows in fine flesh prove to be badly diseased, and these animals will eat well and appear well until within a short time of their death. Then the disease suddenly lights up and they shrivel away rapidly.

The amount of milk a cow gives depends on her inheritance. Which way has a grade animal inherited? A cow with her second calf ought to make ten pounds of butter a week. Use a little glycerite of tannin on teats after milking. Before milking wash the teats with water and dry them with a soft cloth and then use a little meal or flour to be sure they are absolutely dry before milking. Keep the hands dry while milking, using a cloth to wipe them if they are at all moist.

It is a hard practice to break up. A halter on the head with a surcingle around the body, and a broom handle tied from one to the other carrying it between the front legs, is the easiest on the cow. A short piece of wire fastened from the halter to the end of the broomstick gives it play enough and then a small pad on the back under the surcingle will keep it from rubbing her back.—M. E. S.

### Soft Shell Eggs.

Can you tell me what to give my hens to keep them from laying soft shell and very thin shell eggs. Am feeding wheat, Egyptian corn and scraps from the table, and they have plenty of meat scraps, oyster shells, lime and dishes broken up before them all the time, also have plenty of green food. Have 27 hens in a yard about 50x100 feet, laying from 1. to 21 eggs a day.—Mrs. M. E. W., Fresno.

Your hens certainly are laying well for this time of year, but lack something necessary to produce hard shells, and the soil must be lacking in some mineral they need, so it would be well to have a load of coarse sand hauled in for them, and also to give them granulated bone. Fresh green cut bone is preferable, of course, one-half ounce to each hen every other day, but is not always easy to obtain.

If the yard has become smooth and hard, it would be well to have it broken up so they can pick around and dust themselves in fresh earth, and find elements in the soil that they need "in their business." This would make the sand unnecessary, if the soil is of a sandy nature. Grain scattered in loose soil covering the grain partly, will induce them to scratch up the fresh dug earth, and give them exercise.—Mrs. Metcalf.

### Worms.

Every one of my young leghorn chickens that I have killed has four or five worms in its intestines. What is the trouble and what is the remedy?—B. P.

There are two kinds of intestinal worms, the round worm, and the tape worm. The round worm is much the more common, and a few of them make litle impression on the health of the fowl, but a number will cause diarrhoea and mal-nutrition, as they will take the nourishment from the bird and stop the intestinal passages if allowed to increase. The treatment for a flock suspected of being wormy is to withhold food for a day, then mix a mash containing two grains of santonin for each bird, dissolved in the water with which the mash is to be mixed first, then stir up and add one-half teaspoon castor oil to each bird (adults, this quantity would be sufficient for four month old chicks) and feed at night. Watch the droppngs next day, collect and burn, or bury deeply. A little sulphur fed occasionally in milk or mash, is an excellent preventive, to keep the birds free from worms, and is safe and sure remedy in dry weather, but not advisable for cold, damp weather.—Mrs. Frank Metcalf.

### An Open Question.

I was about to put down some eggs, according to directions in the Cultivator, in water glass, but was told that they should not be put down in mid-summer, but either before or after the great heat. I would be glad to know if in the experience of the readers of the Cultivator, this advice has been confirmed.—N. M. T., Orland.

Mrs. Metcalf is of the opinion that

If You Could Know Positively

Without Any Expense or Obligation

that a U. S. Cream Separator would greatly increase the earning power of your dairy, would you hesitate for a moment giving one a trial?

Surely you would not.

Then write us for agent's name in your locality, asking for Catalogue No. 20 we will do the rest.

Don't Experiment With Your Horses
Use TUTTLE'S ELIXIR
And Be SURE

THIS "Old Standby" has solved the problem of *making* and *keeping* horses sound for thousands and thousands of Farmers, Trainers, Express Companies, Transfer Companies and all those who work horses of any class.

It is the surest and quickest remedy known for such common leg, hoof and internal troubles as:

**Curb, Splints, Spavin, Ring Bone, Contracted and Knotted Cords, Cockle Joints, Bony Growths, Sprains, Swellings, Shoe Boils and Founder, Distemper and Colic.**

If you have a horse that Veterinarians and other medicines have failed to bring back to condition—don't give up. Try Tuttle's Elixir. It has accomplished complete cures where all else failed.

And keep it on hand for emergencies. It is the best Horse Health Insurance money can buy.

Ask us for the proofs. We make no claims which actual experience in thousands of cases does not back up.

TUTTLE'S ELIXIR CO.,

OTHER remedies equally popular for many years among our thousands of friends are:

**Tuttle's Family Elixir,** for ailments of the human family.

**Tuttle's White Star,** matchless liniment for healing and drying.

**Tuttle's American Condition Powders,** for purifying blood.

**Tuttle's American Worm Powders,** a positive worm expeller.

**Tuttle's Hoof and Healing Ointment,** for hard and cracked hoofs and hoof diseases.

**FREE** "Veterinary Experience," a 100-page book on the care and treatment of the horse, by Dr. S. A. Tuttle, a Veterinary of long and successful experience and of highest reputation. Valuable illustrations showing anatomy of the horse, with chapters dealing with all sides of the question.

Ask your dealer for Tuttle's Elixir and other remedies. If not there we'll ship direct by express. Don't experiment. Get Tuttle's and be *sure*. Write us now for the *Free Book*.

If eggs are gathered fresh several times a day during hot weather, not allowing them to over heat in the nest they will keep, but would be glad if some one who has tried it out will give experience.

### Crimson Winter Rhubarb.

I sowed crimson winter rhubarb last March. Some of the plants are too heavy and others did not grow at all. Some are a foot high, while others are only two or three inches. Should I transplant them now in rows in order to make them easier to handle and irrigate?—F. C. T., Santa Ana.

The seed of crimson winter comes very uneven; as the writer says, some high, some not at all, and some indifferent. The smaller ones should be thrown away and the thrifty larger ones used in transplanting. It would not be wise to plant all as they come from the seed. Like nearly all seedlings, rhubarb is liable to give a large percentage of unsatisfactory plants.

### Rust On Snapdragon.

Enclosed find leaves of antirrhinum (snap-dragon) which are badly affected with rust. Many plants afflicted become sickly and soon die. What is the cause and remedy?—M. D. Woodruff, Alameda.

Prof. Smith of the Southern California Pathological Laboratory answers: "The snapdragon leaves sent are affected by one of the true rusts, similar to grain rust, asparagus rust and other similar fungi. This disease seems to have become very common and general in California during the last few years. There is no effective remedy for the trouble save in so far as good care and plenty of water may promote the vigor of the plants."

### Summer Pruning.

How far should the summer pruning of peach trees be carried? Should it be confined to the suckers, or is it advisable to cut out large limbs? I am advised not to cut the larger limbs.—W. W. A., Modesto.

The advice not to cut large limbs is good. Apricots will stand it if done immediately after the fruit is removed, but with peaches the pinching back of the ends and of course the removal of suckers is about all that should be permitted. The forming of the head and the pruning of the larger branches should be left till winter.

### Cabbage Lice.

Please tell how to kill lice on cabbage plants. Have used slacked lime and ashes, dry sulphur, soap suds, coal oil, etc., without any good results.—New subscriber, Arroyo Grande.

The easiest way to get them off is to keep them off. If you keep the plants clean from the seed bed and the field free of all living things on which the lice can maintain life, it will be but little infested. If they commence to come into the field from one side, it is probably the safest plan to destroy every plant as soon as lice appear upon it. Kerosene emulsion spray is the next best thing, but it is almost hopeless when they have secured a good foothold. It surely looks as if the treatment you have given would destroy them if anything would. If you have only a small number of plants in the garden, hot water will probably give relief.

### Lippia Lawn.

Our house was built in an alfalfa field thickly grown with Bermuda. We have planted a small quantity of lippia which has spread over the lawn space, but though we have been fighting the Bermuda all the time, its blossom stalks force their way through the lippia, though the lippia continues to grow and form a mat on top of the Bermuda. Can anyone inform us if the lippia will finally kill out the Bermuda?—O. M. B., Bakersfield.

We shall be pleased to hear from our subscribers who have had experience along this line. Until such time, we should encourage the lippia as much as possible and hope in time it may smother the Bermuda which will not live under cover. It must be in the light and sun.

### Soy Beans.

When should soy beans be planted?—E. M. C., Kern.

The soy bean is very similar in growth to the ordinary horse bean and should be treated in the same way. It may be planted now. It is a winter grower.

## Veterinary

**Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.**

### Lame Horse.

My horse has spells of getting lame in her hind leg so she has to drag it, then suddenly gets over it. It seems like stifle is out. Also I have a valuable colt, was cut in her front heel two months ago. The cut is deep and don't heal or knit together. One corner of her heel sticks out. Would it be better to bandage it up?—H. S. G., Murietta, Cal.

My opinion is that your horse does get its stifle out of place. The cut on the colt's foot will heal much faster if bandaged. Use a solution of sulphate of copper and water, as strong as you can make it. Saturate some gauze or cotton and bind on tight. Dress once daily.—R. T. W.

### Swollen Ankles.

A three year old mare, broken this spring to orchard work, at first used three hours per day and lately worked a half day at a time, is bothered with swollen ankles. At first this swelling would recede, but lately it is assuming a permaneut aspect and remains at above twice the normal size What can be done to correct it?—Subscriber, Fair Oaks, Cal.

The swelling is undoubtedly due to weak ankles or over work. Treatment should be plenty of cold showers. Paint with iodine and cover with a light bandage. A bandage of adhesive tape neatly rolled on will strengthen the ankle. This can be left on for several days.—R. T. W.

### Possibly Mange.

My horse is troubled by scratching his tail, then his mane. Afterwards the hair began falling from his head aud back The horse appears to be in perfect misery. Two others have started with the same disease. Some say it is mange, others say it is worms. Some suggest that it might be lice. I have separated them from the other stock, white-washed the premises several months ago and used a number of different remedies. At present I wash off with warm water and a little lye, then put on sheep dip diluted with fish oil. It appears to relieve them for a while, but in a few days they scratch as bad as ever.—J. K., Santa Paula, Cal.

Make a solution of bi-chloride of mercury, three drams to a gallon of water and wash the parts once daily, well rubbed in with a brush. As this solution is so extremely poisonous, it will be advisable to add a little bluing so that no mistake can be made.

**DR. WHITTLESEY'S VETERINARY REMEDIES.**

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Cellar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

## Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

### MISCELLANEOUS.

### MY CREED.

This is my creed: To do some good,
To bear my ills without complaining;
To press on as a brave man should
For honors that are worth the gaining;
To seek no profits where I may
By winning them bring grief to others;
To do some service day by day
In helping on my toiling brothers.

This is my creed: To close my eyes
To little faults of those around me;
To strive to be when each day dies
Some better than the morning found me;
To ask for no unearned applause,
To cross no river till I reach it;
To always have a worthy cause,
To fearlessly and fairly preach it.

This is my creed: To wisely shun
The sloughs in which the foolish wallow;
To lead where I may be the one
Whom weaker men should choose to follow.

### GETTING A COMPLETE CHANGE.

MRS. MENDENHALL stepped briskly into the room, ten minutes before the time for the meeting of the Women's Aid society and the assembled members hastened to give her a hearty greeting.

"There's no need to ask whether yau have been benefited by your trip, said the much-traveled member. "The answer is written all over your face. You look like a different woman!"

"Yes, indeed," responded Mrs. Mendenhall. "I'm feeling ever so much better. There's nothing like a change to build one up!"

"Did you go away for your health?" asked the woman who was born in Chicago and had never been farther away than Aurora.

"Yes. I was all run down. I hadn't any appetite—simply couldn't bear to think of eating—and the doctor said what I needed was a complete change. So my husband arranged his business and we started out to travel for a month."

"I don't see how you dared to start, feeling as you were," said the member who never left Chicago.

"Well" replied Mrs. Mendenhall, "it didn't take long to prove that the doctor was right. I hadn't been away 24 hours before I began to feel as though I could enjoy a beefsteak and a cup of tea."

"Oh, I just envied you when I heard you were going to New Orleans," said the traveled member. "It's such fun to dine at the French restaurants. Didn't you enjoy the broiled pompano and the shrimps a la creole? Those things don't taste the same in Chicago. And the coffee! I think you never know what good coffee is till you go to Louisiana!"

"My husband said it was good, Mrs. Mendenhall answered. "I didn't try it. I always drink tea when I can get it—black tea. We went to a restaurant where they had those French things, but I couldn't make out what the bill of fare meant and I ordered a beefsteak."

"You stopped at El Paso didn't you?", ventured the member who had a cousin in Texas. "Clara says some of those Mexican dishes are very appetizing."

"I'd heard about Mexican cooking," was the response, "and what a lot of pepper they put into everything. So when we got off the train at El Paso I said to my husband: "You can try all the peppery stuff you want, but no experiments for me!'"

"It must have been the ripe olives and oranges you got in California that started you on the road to health," said the traveled member. "You never realize how good oranges can be till you eat them under the tree on which they grew!"

"I saw some ripe olives," replied Mrs. Mendenhall, "but I didn't taste them. The oranges looked ever so pretty on the trees, but I don't believe in eating fruit and other stuff between meals. The fact is," she continued, "as I told you, I hadn't more than got started before I began to feel as though I'd enjoy a beefsteak; so my husband ordered a good sirloin steak and potatoes and a cup of tea and a piece of apple pie.

"Well, it tasted so good that I kept on ordering just the same things every meal, only leaving out the pie for breakfast, clear around from Chicago to Los Angeles and back again! And I must say it's done me a world of good! Why, I've gained 11 pounds!"

There was a twinkle in the eye of the traveled member as the president of the society called the meeting to order; but the woman who never left Chicago leaned over and whispered:

"I think you were very sensible, Mrs. Mendenhall. It was really the only safe way to do."—Chicago Daily News.

### DOROTHY'S PRAYER.

Little Dorothy at the age of six was very thoughtless regarding the care of her clothes and the many admonitions she had received about neatly arranging her clothes on a chair each night before retiring were daily forgotten.

One night, just as she was ready for bed, her mother came in, and, finding the little garments in a heap on the floor, as usual, said: "Dorothy, you may say your prayers and then mother will have to punish you for not minding her about your clothes." Having said this she stepped into the adjoining room and partially closed the door.

In a few moments she heard Dorothy, who was a firm believer in the power of prayer, repeat: "Now I lay me," and after the "amen" she heard this appeal: "And, dear Lord, if ever you wanted to help a little kid, now's your chance."—Delineator.

### THE EASIEST WAY.

She—And knowing my sentiments on the subject, did that odious Mr. Binks insult you by offering you a drink?

He—That's what Mr. Binks did.

She—And how did you resent it?

He (meekly)—I swallowed the insult.—Baltimore American.

If you're loyal to a man who turns out right you will have something to boast of. If you are loyal to a man whom every one else deserts for his faults you will have something to be rewarded for in the final judgment.—Strickland W. Gillilan.

Damp salt will remove the discoloration of cups and saucers caused by tea and careless washing.

### FOR CLEANING.

Alabaster.—Use strong soap and water.

Black Silk.—Brush and wipe it thoroughly, lay on table with the side intended to show, up; sponge with hot coffee strained through muslin; when partly dry, iron.

To remove stains or grease from oil paint.—Use bisulphide of carbon, spirits of turpentine, or if dry and old, use chloroform. These and tar spots can be softened with olive oil and lard.

Stains, iron rust, or ink from vellum or parchment.—Moisten the spot with a solution of oxalic acid. Absorb same quickly by blotting-paper or cloth.

Fruit spots from cottons.—Apply cold soap, then touch the spot with a hair pencil or feather dipped in chlorate of soda, then dip immediately in cold water.

Grease from silks.—Take a lump of magnesia, rub it wet on the spot, let it dry, then brush the powder off.

Iron rust may be removed from white goods by sour milk.

Scorch stains from white linen.—Lay in bright sun.

Oil marks on wall paper.—Apply paste of cold water and pipe clay, leave it on all night, brush off in the morning.

Paint spots from clothing.—Saturate with equal parts turpentine and spirits of ammonia.

To cleanse house paper.—Rub with a flannel cloth dipped in oatmeal.

Black cloth.—Mix one part of spirits of ammonia with three parts warm water, rub with sponge or dark cloth, clean with water, rub with the nap.

Furniture, for fingermarks.—Rub with a soft rag and sweet oil.

Zinc.—Rub with a piece of cotton cloth dipped in kerosene, afterwards with a dry cloth.

Hands from Vegetable stains.—Rub with a slice of raw potato.

Window glass.—Paint can be removed by a strong solution of soda.

To clean tin ware.—Common soda applied with a moistened newspaper and polished with a dry piece, will make it look like new.

### WEIGHTS AND MEASURES.

Two tablespoons of powdered sugar make one ounce.

Two tablespoons of flour make one ounce.

Four cups of sifted flour make one pound.

Four cups of liquid make one quart.

Two cups of solid butter make one pound.

Two cups of granulated sugar make one pound.

Ten eggs make one pound.

### POISON OAK REMEDY.

An exchange gives the following remedy for oak poisoning, which reads as if it would do the work if the polsoning is only skin deep. A few persons seem to be so constituted that no external remedy will effect a cure:

It is about time for people to get poison ivy, poison oak and kindred plants when gathering flowers in the woods. The Government recipe for an antidote in such cases is to make a 50 per cent solution of alcohol—one-half—and to add to this enough acetate of lead to make a saturated solution—as much as the liquid will dissolve—wet a cloth in this solution and lay it on the parts blistered by the poison; it will allay the itching and effect a cure if your blood is not in too bad a condition. The remedy is rank poison to take internally.

You can prevent being poisoned by washing face and hands in the above solution after returning from the hills where you have been exposed to the poisonous plants. Or, use a strong salt brine or a solution of baking soda in water. The poison is an acid exuded from the leaves and the lead, salt or soda solutions are alkaline, and immediately neutralize the poison.

### UNCLE ZEKE SAYS:

Sum one ort to propose a tariff on members ov th' Annyias Club. Rosyvelt will hav so menny foriners admitted before he gits back thet a nuther American industry will be ruined.

We've heard tell that men spring frum th' monkeys; but we're quite shure wimmen spring frum th' mice.

Wunder why wimmen call it a "rat" Rabbit would be a hull lot more appropriate. Thet would sound more like hare.

It iz th' block head thet iz allus goin 'around with a chip on hiz shoulder.

If we kud buy husbands for what their wives think they air wuth and sell 'em fer what they think themselves wuth, we'd soon hav Mister Patten distanced.—Journal of Agriculture.

### FOR A BRIDE'S DOWRY.

There is a very pretty custom in some of the northern parts of Europe. There the white poplar in good soil increases a shilling in value every year. The trees are generally cut down at the age of twenty years, as they are then supposed to have attained their full growth. When a daughter is born in the family of a well to do farmer the father as soon as the season permits plants a thousand young trees, and these are to constitute the dowry of the maiden, "which grow as she grows and increase in height and value as her virtues and beauty increase."

Every year in December says an exchange a goose fair is held in Warsaw, Russia, on a gigantic scale. It is estimated that on an average no less than 5,000,000 geese are driven to the town and sold. These have to travel from 40 to 150 miles on foot. Most of them come from the Vilma district, to the northeast of Poland. To enable the birds to stand these long journeys, the geese are shod. The method of shoeing them is simple and interesting. They are made to walk to and fro for a time in melted tar hot enough to stick, but not to burn their feet. Then they are turned loose on a sand heap. The result is a pair of shoes durable enough to last on the journey.

A delicious accopaniment for afternoon tea, or to be served with a green salad at dinner, is a bread-and-butter sandwich with a filling of cream cheese. Toast the sandwich, which should be very thin, on both sides, and serve very hot.

# Angle Lamp

**The Light That Never Fails**

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

**NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.**

**GREAT ECONOMY—COST LESS TO BURN** than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT**, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 1 quarts of oil.

### Hay.

Arrivals of hay during the past week have amounted to 5700 tons, which is the largest amount that we have received at any time this year. There is now a great deal of hay coming in by water, as a fleet of boats are now engaged in moving that part of the crop which enters this market from the bay shores coming by water. It is unusually late in the season for this movement of hay to start, as in former years most of the hay from these districts began to be moved into San Francisco at the earliest period of the season.

The increase in our arrivals during the last fifteen days has been occasioned mainly by these quantities hay coming by water, as the arrivals by railroads have not increased to any large extent. However, it must be known that arrivals by railroads would have been heavier had the railroads furnished the cars that shippers have been asking for. At a number of points throughout the hay sections the railroads have not been able to supply the increasing demand for cars for shipment of hay to San Francisco.

It is to be expected that these heavy arrivals must continue from now on, to be able to accomplish the removal of all the hay that is still in the fields into the market in due time.

Alfalfa hay has been arriving in larger quantities, and while there is no active demand, offerings of this class of hay have found a fairly ready sale. The market condition on alfalfa hay, sympathizing with the general market on other varieties of hay, is a little weak.

This week's quotations are:
Choice wheat hay .....17.50@18.50
No 1 wheat or wheat & oat .....16.00@17.00
No 2 wheat or wheat & oat .....13.50@15.00

## Deciduous Market

SACRAMENTO, August 11, 1909.

Total shipments of deciduous fruits east this years are over 1000 cars in excess of last year, or a total of over 5000 cars, with indications that the season will be a record breaker. Prices are fairly satisfactory and all good stock is being picked up. The California Fruit Distributors are forwarding 150 to 200 cars a day. Eastern sales made on the 6th averaged: New York—Bartletts $1.80, Elbertas $1.00, Sugars $1.20, Susquehannas 65c, Crawfords 65c, Malagas $2.20.

Philadelphia—Bartletts $2.25, Crawfords $1.00, Sugars $1.05, Tragedies $1.25, Thompson Seedless $1.20.

Chicago—Crawfords 70c, Elbertas 75c, Bartletts $1.80, Beurre Hardies $1.35, Eggs $1.55, Gros $2.00, Germans $1.25, Malagas $1.40, Muirs 50c, Sugars $1.55.

Fruit Exchange sales on the same date were as foliows: Boston—Bartletts 1.85@2.55; Crawfords 65@1.40; Elbertas 1.25@1.55; Susquehannas 90c; Egg Plums 1.30@1.40; Thompson Seedless 1.35@1.55.

Chicago—Bartletts 1.80@2.10; Tuscans 45@80; Fosters 45@80; Muirs 50c; Elbertas 65@90; Silvers 45@90; Crawfords, crates, 45@75; Crawfords, boxes, 55@70; Fontainbleaus 90@1.25; Malagas 1.35@1.75; Kelseys 1.50@1.90; Tragedies 1.90@1.95 ; Germans 1.00@1.25; Sugars 55@1.65; Egg Plums 1.10@2.05; Hungarians 1.90@2.35.

Philadelphia — Bartletts 2.10@2.30; Sugars 1.00@1.25; Crawfords 90@1.00; Elbertas 1.10@1.25; Fosters 1.05@1.20; Thompson Seedless 1.20@1.25.

Pittsburg—Bartletts 1.95@2.05; average $2.00; Columbias 1.20@1.30, average $1.25; Kelseys 1.80@2.00; peaches 80c.

New York—Egg plums 1.25; Gros Prunes $1.85; Bartlctts $2.00; Empire Peaches 60c; Imperials 75c; Crawfords 75c; Late Crawfords 75c; Fontainbleaus $1.50; Tokays $2.25; Susquehannas 70.

On the 7th the Distributors prices averaged: New York—Bartletts $1.80; Elbertas $1; Sugars $1.20; Susquehannas 65c; Crawfords 65c; Malagas $2.30.

Philadelphia—Bartletts, $2.25; Crawfords $1; Sugars $1.05; Tragedies $1.25; Thompson Seedless $1.20.

Chicago—Crawfords 70c; Elbertas 75c; Bartletts $1.80; Hardys $1.30; Eggs $1.55; Gros $2; Germans $1.25; Malagas $1.40; Muirs 50c; Sugars $1.55.

---

It is reported that Honolulu has to make a continual fight to prevent introduction of plants and shrubs from the orient which are infected with all manner of diseases which the islands are attempting to keep out.

# Citrus Market

LOS ANGELES, August 11, 1909.

Oranges are looking up, especially as to the more desirable sizes of the better quality fruit. Off sizes and low grade fruit occasionally meet with discouraging reception, but with more severe culling on the part of shippers, the fruit yet to go will surely command fair prices. There are between seventeen and eighteen hundred cars yet to go. The remainder of this month will see fairly heavy shipments which will probably be somewhat lighter during September. Early October will no doubt see the final cleanup.

Lemons are looking materially better as to prices. The amount now being cut is much less than during July. In fact, the shipments seldom exceed two cars per day, which is a little more than half the average daily shipments during July. The cent and a half tariff now prevails, and this, with the lighter shipments from California, gives assurance that the remainder of the crop will give fair returns.

**Shipments.**

Total shipments of oranges since November 1st, 1908, 29,357 cars; lemons, 5,467 cars, or a total of all citrus shipments to date of 34,824.

---

NEW YORK, Aug. 9.—Fifteen cars oranges and one car lemons sold. The market is very steady on oranges and lemons. Weather is hot and sultry.

60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it fails to do this, **any** money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

Write for Catalogue.

# Semi-Tropic Fruits of Hawaii

## The Diversity of the Island Products is Being Made Known More Every Year. Irrigation and Better Knowledge of Soil Conditions Will Make Them Wonderfully Rich Islands

THE Hawaiiasn Islands, as a whole, are of volcanic origin and all rocks from which the soils have been formed, may be considered as basaltic lava. This lava came from craters or crevices formed by volcanic eruption, under a considerable variety of forms, and the original rock material was, therefore, solid, smooth masses of basalt, broken masses of such material containing cavities in which steam and other gases were formed, or finely divided volcanic cinder. From these materials, the present agricultural soils have been formed by processes of disintegration, due to chemical changes, the effects of water, and the growth of plants.

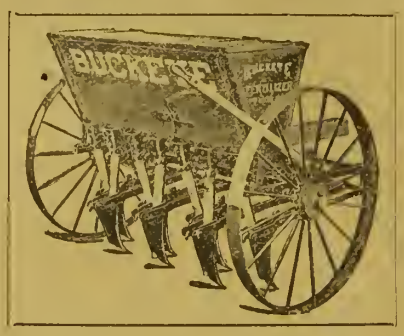
On account of the range of altitude on the different islands, there are conditions suitable for the growth of almost all the agricultural crops of the world. While at present sugar is the main crop, there are also large plantations of coffee, rice, sisal, rubber, fruits, forage plants, etc. Various kinds of hay, alfalfa, matting plants, tobacco, corn, cotton, wheat and other cereals, sorghum, Manila hemp, Sansevieria, and other field crops are found in thriving condition in various parts of the islands. In the production of fruits, there is practically no limit, either in the fruits of temperate climates at higher altitudes, or of tropical fruits at lower altitudes.

For use in orange groves and vineyards there is nothing better than the

# Buckeye Fertilizer Drill

Set of plates furnished **FREE** with each new drill, if desired.

**For Sowing Vetch and Peas**



We have sold a great many carloads of these drills in Southern California and the Buckeye is now recognized by orange growers and fertilizer men as the best drill made for handling commercial fertilizer. Its low wheels, proper sized box, and large feed openings giving great capacity when desired, make it especialy adapted to orchard use.

Vol. XXXIII—No. 8 Los Angeles, California, Thursday, August 19, 1909 Subscription $1 a Year

# Morning Glory Pest of the Ranches

## A Strong Hand Should be Taken With This Weed

OF ALL the weed pests with which California is troubled we do not doubt the morning glory is the worst. It does not seem to be at all exclusive in its requirements. It does remarkably well in the damper sections, and shows no dread of hill sides which are so dry that but few other forms of life will exist. No other crop has been found which will in any way compete with it, and it goes on each year claiming larger circles of land.

Queries are continually coming in to this office for suggestions as to how this pest may be combatted. Some have asked if salt would answer, or an acid, or any spray which kills the tops, and so on. On one ranch we know carload after carload of salt has been used in killing it. At the time we saw the experiment being tried, some four or five years ago, the manager of the ranch said that while the salt application destroyed the soil for a period of years, the pest was so serious that he considered it necessary to employ this severe means of preventing its spread over the rest of the ranch. The salt was spread several inches deep over the entire patch and beyond its farthest tips, and of course was effective. It is, however, expensive to apply, and expensive in loss of land until several winters' rains have leached away the salt.

Another method of killing it out has been by the use of tar or heavy building paper. At each lap the paper is covered with a few shovelfuls of dirt to hold it together so as to exclude air. This is effective, as the tops are killed in a very few days, and it has been found that within a few weeks, in hot weather, the entire root system is dead. This of course looks very successful, and on valuable land where expense is not a factor, it may prove satisfactory. The cost is not far from a dollar per square rod.

Digging by hand, even to the extent of screening the soil may be resorted to, but it is fearfully expensive and not absolutely sure. Sulphuric acid has been tried and is effective if used in sufficient strength, but is some four or five times as expensive as the smothering by tarred paper.

Our investigations in many parts of the country show that the pest cannot be controlled easily or cheaply. It is serious, and serious measures must be taken to rid the fields of it.

We refer to this pest as "it" though there are several different varieties. Two at least we may mention, the annual and perennial, the latter with small white flowers and root which goes on extending its field forever by rhizomes. The annual is comparatively easy to eradicate. If one is careful to plow before the crop goes to seed and continue after for a few days, the land is in condition for culture of other crops. In the case of the perennial, if but the smallest piece of the root is left in the ground, that is sufficient to start the next year's crop.

One of the first essentials in handling the perennial weeds is to prevent their being scattered to other parts of the fields. The cultivator or other tool should be put upon one patch and thorough work done. Then the tool should be very carefully cleaned so that not the smallest piece of the weed clings to it, before it is taken to any other part of the place.

# Marking of Tents for Fumigation

## Manner of Marking and Table for Acid and Cyanide Measurements

OWING to the letter from Mr. Woglum in last week's Cultivator, new interest is given to the matter of marking tents and securing of information as to dosage from the marks. We therefore reprint charts originally used in the Cultivator last August. With these charts we quote from Bulletin 79 of the Division of Entomology, written by Mr. Woglum.

In the past many persons have been prone to look upon fumigation as a process that is complex and more or less mysterious. In some cases fumigators of years' experience have encouraged this widely prevailing opinion, so that they might themselves be looked upon as experts in a practice difficult to understand and only capable of being successfully performed by men of long experience and special qualifications. This is, of course, erroneous. The improved system outlined in these pages shows how simple the practice of fumigation may be made. Careful men who have never before heard of fumigation can begin the practice of this system and are competent, after instruction for a short time, to secure as good results as might be expected from the most expert fumigator in California. This system reduces fumigation to a matter of simple mechanical operation, entirely intelligible to the average man, and one wherein the operator, to obtain the best results, is required merely to proceed according to the formulas and directions given.

### Marking the Tent.

In figure on pages 175 is shown an outline of a regulation fumigating tent marked after the Morrill system. Three parallel lines and one line at right angles to them are indicated on the tent. The middle one of the three parallel lines passes through the central point in the tent canvas running lengthwise of the central section or strip of which the tent is made and passing over the top of the tent from the edge on one side to the edge on the opposite side; these lines also run in the direction in which the tent should be pulled on or off a tree. The single line at right angles to the parallel lines passes through the central point, as does the middle one of the three parrallel lines, and extends also from the edge on

# WISS

**Solid Steel**

## Pruning Shears

**Will Snip a Broom Handle**

That gives you an idea of the strength and quality of the pruner. Wiss Pruning Shears will outlast a dozen ordinary ones. They will cut tissue paper. That shows how nicely they are adjusted. Nurserymen and growers of fine trees use them in preference to all other shears—they will cut clean the thickest twigs or the most delicate tendrils without tearing.

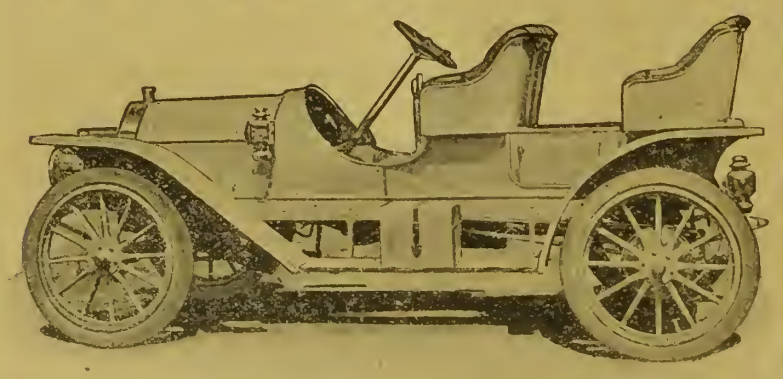
Wiss dealers will replace free of charge any shears returned defective or unsatisfactory. All parts are interchangeable. If any part (say the blade) becomes worn, it can be replaced, thus making the shears as good as new at a slight cost.

**Made in three sizes—9-inch, $2.25; 10-inch, $2.50. No. 3 B (7¼-inch) for light pruning, $1.75**

*Extra blades, 50 cents each. For sale by all dealers.*

**J. WISS & SONS CO., 15-33 Littleton Avenue, Newark, N. J.**

# DUROCAR



Made in California. Will Climb any mountain grade or sandy road. Write the factory direct. We can save you money in first cost and in cost of operation.

## DUROCAR MFG. CO.

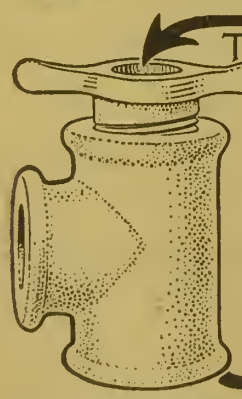
## The Tee Irrigating Valve



Simple in design and construction, costs less and will last longer than any other on the market.

The Tee Irrigating Valve is made of an ordinary malleable iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities.

There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.

A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.

Address **George C. Roeding, Fresno, California**

# SECOND HAND PIPE

We will sell you pipe that can be used for any purpose. ***Satisfaction guaranteed*** or money returned. We handle all sizes of standard pipe and casing. Shipments made on same day as order is received. Price of pipe is low now. Write for our prices.

***Pacific Pipe Company***

***S. W. Corner Howard and Main Streets, San Francisco, California***

### NITROGEN GATHERING BACTERIA

TO many people the name bacteria means some kind of dangerous germ life that is all very interesting to scientists, but entirely too difficult a matter for ordinary people to think about or attempt to understand While this may be true in a sense, it is also true that while we may not have the opportunity of studying these minute forms of life under the microscope, we may learn how to use them to best advantage and leave their selection and breeding in the hands of the specialist just as we learn how to use the electric current for light and power without knowing how to produce it. We use yeast every day in our households, which is a preparation, the efficiency of which is due to the gas making bacteria (fungi) which it contains, and the good results are due to the fact that we have learned how and when to use it.

The soil in our fields is full of thousands of different kinds of bacteria, each having a different kind of work to perform, and scientists for many years have been carefully selecting and studying the uses of different kinds to the end that the beneficial bacteria might be used more largely in improving worn out soils and maintaining the fertility of our land.

Dr. Earp-Thomas at his laboratory in Bloomfield, N. J., is carrying out experiments with bacteria which may prove a great advance possible over our present methods of fertilization, but to benefit by his experience and get the best results, we must use these minute organisms intelligently and study the conditions under which they will produce results.

Farmers who know of the great value of alfalfa for a forage crop have become discouraged after repeated failures to grow it, and have been led to believe that it was impossible to succeed with it, except in certain favored localities. Now, this is a wrong impression. Some conditions, such as wet, soggy land, or land with close lying hard-pan sub-soil, would be most unfavorable, but the writer feels safe in saying that 80 per cent. of the farms of the country can grow this wonderful crop to good advantage if three things are properly attended to, viz: proper cultivation of land before planting; the use of plenty of lime and the introduction of highbred bacteria that have been grown in a jelly. This is important, as the only preparations of bacteria that the writer has ever seen that were pure were raised and sent out in this way.

It is in most cases impossible to detect the presence of other bacteria in a liquid, whereas when grown on the surface of the jelly-like food, any contaminations are apparent, and can be promptly destroyed. Avoid cultures sent out in bottles that will not admit a supply of air, as the bacteria soon exhaust the air in the bottle, become dormant, and eventually die.

If you intend to use bacteria, perhaps the first matter to consider is whether the soil is in right condition. Many people fail to get results from the use of bacteria because they invariably attribute a crop failure to lack of fertilizer, when in many cases it is due to bad cultivation, acid conditions, etc. Now, nitrogen gathering bacteria are plants, the successful growth of which is subject to a great extent to soil conditions, and if they are to be successfully used as a means of furnishing nitrates, the condition of the soil must be considered. Land that has not been well cultivated, becomes favorable for the growth of an army of bacteria that produce acid or sour conditions that are unfavorable to nearly all crops, and the beneficial nitrogen gathering bacteria are no exception to this rule. Lime and proper cultivation rectify this trouble, because the lime kills these bacteria. Many agriculturists believe that all that is necessary when the land is in right condition is to plant the clover, peas, beans or other legumes, and that in places where these plants have been successfully grown before, there will be an ample supply of bacteria ready to do the work, or that where a legume crop, that is new to a locality, such as alfalfa, is to be grown, all that is necessary is to secure some soil from an old field in another locality, spread this and thus supply the bacteria. Now, leaving out the question of the danger of transfer by this means of soil diseases and weeds, it seems to me that when we can secure bacteria that have been bred to secure high power for producing nitrogen, and in such form that all we have to do is to put them on the seeds before planting, the first plan is about as sensible as it would be to secure a supply of wild strawberry plants for the garden, or try to improve our cattle by the introduction of worn out strains.

The nitrogen gathering bacteria are not a "cure-all," and would be of no use where soil or plant diseases are responsible for crop failure. Neither do they take the place of phosphates, potash and lime. What they will do under fair conditions is to supply nitrates, and nitrates in most cases are what our land is most sadly in need of. People are coming to realize more fully the advantage of planting a legume,, and treating this with bacteria to make nitrates for the next season.—B. N. J.

---

### FUMIGATION.

(Continued from Page 171.)

one side to the edge on the opposite side. Beginning at the center these lines are graduated in feet toward either edge of the tent, after the manner shown in the diagram. For tents above 36 feet (average size) it is unnecessary to commence the graduation nearer than 5 feet from the center of the canvas. When one of these lines is over the middle of the tree the distance over can be calculated by merely adding together the two numbers on the opposite sides of the tent where the edge touches the ground. For instance, suppose that on the line over the center of the tree 12 is nearest the ground on one side and 15 on the other. The distance over the center of this tree would be the sum of these numbers, which is 27 feet. With the lines graduated after this manner it makes little difference in determining the distance over the top of the tree whether or not the geometrical center of the tent is at the center of the tree, the single requirement being that some part of

one of the graduated lines approximates the center of the tree.

The two lines running parallel to this central line should be about 4 feet distant from it in the larger fumigating tents. The reason for using these auxillary lines is, that in practice the center of the tent is very often pulled considerably to one side, especially in covering small trees. If the middle line does not fall immediately over the center of the tree, one of the other two lines is quite likely to do so, and that one should be used in obtaining the distance over.

The cross line running at right angles to the three parallel lines also passes through the center of the tent and is marked like the others. In case of an irregularly shaped tree, by the use of this line the distance over can be taken in two different directions and the average taken for use in determining the cubic contents. In field work, however, this cross line is unnecessary, as measurement over the top in one direction is sufficient.

The measurement around the bottom of the tent can be obtained by the use of a tapeline or by pacing. Under this system the work is facilitated by having a chart or table of figures showing the cubic contents corresponding to different dimensions.

An engraving of the chart used by Mr. Woglum and many other fumigators appears on the preceding page. Regarding the use of it the Bulletin says:

### How to Use the Chart.

The top of line numbers commencing at 16 and continuing through 18, 20, 22, etc., up to 78, represents the distance, in feet around the bottom of the tent. The outer vertical columns of larger numbers, on either side, commencing at 10 and increasing regularly to 59, represent the distance, in feet, over the top of the tent. The dosage of a tree of known dimensions is found in that square where the vertical column headed by the distance around the tree intersects the horizontal line of figures corresponding to the distance over. For instance, we have a tree 40 feet around by 28 feet over. Loking in the top line of numbers we find 40 next after the third heavy vertical line. The dosages computed for trees 40 feet around are to be found in the vertical column headed by this number, which commences with 6 and ends with 16. Then we glance down the vertical column of large figures at either margin until we come to 28. All dosages computed for trees 28 feet over are found in this horizontal line of figures, which commences with 8½ and ends with 16. The dosage for a tree 40 by 28 feet is found at the intersection of this line with the vertical column headed with 40, that number being 11½, the required dosage of cyanide in ounces. Before the numbers 20, 30, 40, 45, 50 and 55, in the lines at the right and left margins are to be found blank spaces, and in the horizontal lines corresponding to these the numbers at the top of the chart are repeated in that part of the chart contining dosage figures. These numbers, repeated in this manner, make is easier for the eye to locate with certainty the dosage figures sought. In the chart used by the writer, the figures representing distances around and over are printed in red. The lines bounding these columns of figures are also red. All the rest of the lines and figures are black.

**ABSORBINE CURES SHOE BOIL.**

J. L. Dexter, East Orange, N.J., in a recent letter stated: "There is no doubt about Absorbine as a cure for shoe boils. One of my mares developed one recently (very large). In not over three days, by the use of Absorbine, I took the same out clean, and I can therefore testify to its value for the cure of shoe boil." If you have a similar case apply the Absorbine full strength two or three times a day, and at night after applying the Absorbine, spread on a coating of soft, wet clay made in the form of a paste. This will dry and crumble off before morning, but for the few hours it remains moist, it will sweat in the remedy and draw out the inflammation. Absorbine at druggists $2.00 per bottle or sent express prepair upon receipt of price. Write today for free booklet, to W. F. Young, P.D.F., 244 Temple St., Springfield, Mass.

**You Can Make All Your Land Productive by Pump Irrigation**

THERE will be no knolls and high spots that you cannot reach if you irrigate by pumping.

And your garden truck, small fruits, grasses and grains will not suffer if the ditch breaks or if the water is not running when you want to use it.

Radical changes have been made in irrigating methods since the perfecting of the powerful I. H. C. gasoline engines.

They have made irrigation by pumping possible and profitable.

**I. H. C. Gasoline Engines Pump Water Economically**

They cost little for fuel and they require but little of your time to look after them.

Best of all, they give you the great advantage of an independent water supply. You can have your own reservoir and irrigate from it whenever you like. Or you can pump the water when you want it and just where you want it from ponds or wells on your own land or from the waste and seepage waters in the running streams.

One of these powerful and ever ready engines may afford you a perfect solution of your irrigating problem.

Is it not worth investigating?

For general purposes there are many styles and sizes of I. H. C. gasoline engines:

**Vertical** 2, 3 and 25-horse power.
**Horizontal** (stationary and portable) 4, 6, 8, 10, 12, 15 and 20-horse-power.
**Gasoline tractors** 12, 15 and 20-horse power.
**Famous air-cooled** 1 and 2-horse power.
**Famous skidded engines** 2, 3, 4, 6 and 8-horse power.
**Also a complete line of Famous mounting engines from 4 to 20-horse-power, and sawing, spraying and pumping outfits and jacks.**

See the International local agent in your town about it. Very likely he will have an engine to show you and will supply you with catalogues illustrating and describing the many different styles and sizes. Catalogues and full particulars are also furnished on application to the home office or nearest branch house.

# Deciduous Fruit Culture

By J. W. Mills

## SUMMER PRUNING OF FRUIT TREES.

THE seasons when pruning is most generally practiced are summer and late fall, summer pruning being conducted at various times through the summer, and winter pruning principally in December to February By adopting a proper system of summer pinching and stopping much good may result to the branches retained from their being more exposed to the light, and there will be less need of cutting severely in the winter. When branches are allowed to grow at will, particularly towards the center of the tree, they frequently become too vigorous for fruit-bearing themselves, and by utilizing the sap render others unproductive. If attention to summer stopping in such cases is neglected, and the strong branches are removed at the next winter pruning, it invariably happens that a difficulty arises in getting the flow of the sap equalized, and the next spring other even stronger shoots start from the position where those of the previous year have been taken away.

Summer pruning, then, in relation to permanent training, may commence as soon as the relative strength and position which the young shoots are likely to take can be ascertained. It must be continued at intervals, according to the subject under treatment and its natural mode of fruit-bearing. Trees that produce fruit on the short side branches, which are usually termed spurs, may be subject to a course of summer pruning with a view to the production of those spurs furnished with blossom-buds.

This work must not be performed before the shoots have reached a certain stage, else the buds at the base of the spurs left will develop into growth the same season, instead of remaining dormant and forming themselves into fruit-buds for the next. July or August is generally the most suitable month; the wood is by that time partly solidified, and if the leading branches are left unstopped, and there is a crop of fruit. most of the sap will be utilized. It not infrequently happens that fruit trees which bear on spurs become from constant pruning too thickly furnished with them, and some get long and unfruitful. It is then best to cut same back hard at the winter pruning, only leaving such as are properly situated. In most cases other shoots will proceed the next year from near the place where the old spurs have been taken away, and these may in due course be subjected to similar treatment, and allowed to remain if there is sufficient space.

The summer pruning of fruit trees which do not bear on spur branches is of an entirely different character. Apples, apricots, pears and plums—four of our principal fruits—bear more or less on what is called young wood—that is, wood made during the previous year. Summer pruning of these trees consists, therefore, in cutting out whatever wood is known to be useless, and in laying in and encouraging new shoots to take its place.

Disbudding may be considered a branch or part of pruning, inasmuch as the young shoots removed thereby at an early stage have not to be taken out afterwards, and the full exposure to the light, which is such an essential condition, is insured to the foliage of those that are allowed to remain.—St. Jo. Fruit Grower.

## THE USE OF THE MULCH.

The practice of mulching for potatoes has much to commend it in hot, dry climates, as the mulch conserves the soil moisture, but is not so successful in a wet season unless the ground selected is well drained. Another reason for the use of mulches is that it saves cultivation in the busy season, and in this respect early mulching is preferable to late mulching. A writer in The Agricultural Gazette, of New South Wales, says:

"Perhaps no other field or garden crop is more benefited by a liberal mulch of wheat straw (or other litter) than potatoes, and especially is this the case with the second crop planted, say, January. If the soil be well fined, the potatoes planted closely and covered shallow, and a mulch of from one to three or four, or even six inches of straw applied immediately upon planting, good results are sure to follow. The potatoes will need no cultivation if the straw be applied at once before a packing rain. It prevents the packing of the soil by such a rain, breaking the force of the descending drops, and letting them down to seep slowly into the soil; and, intervening between soil and wind and sun, keeps it there, very largely, at least. It would be a (very) bad year if potatoes failed to do well under such treatment.

"If every farmer who grows wheat will try the following plan he will, in a figurative sense, convert his wheat straw into potatoes: As soon as the stripper has harvested the grain, mow the straw with mowing machine or scythe and rake into windrows, with horse rake or otherwise. Immediately plow and harrow the land between the windrows, and plant the potatoes in the usual way, only they may be planted in rows closer together than the usual distance, in order to economize the mulch. Plant in shallow furrows, and cover with harrow, leaving the land perfectly level. Cover at once with the mulch of straw to whatever thickness you may have straw sufficient for, and the work is done. The potatoes will come up through the straw and flourish, and never be troubled by weeds. No further cultivation will be necessary. When the potatoes are gathered, many fine tubers will be found, not only in the soil, and near the surface, but lying on the top of the ground just under the straw."

It is to be noticed that the above was written for a country that is subject to periods of drouth; also that January there corresponds to July in this hemisphere.

Another writer in the same journal describes an extreme type of the mulch method of growing potatoes which may be used on heavy, stiff lands not suited to potatoes, as follows:

"The ground is plowed deeply and harrowed into a good state of tilth; the potatoes are then placed by hand firmly in the soil until they are about half covered; then twelve to fifteen inches of wheaten straw is placed over them; this completes the planting. Nothing more is done until the potatoes are picked—not dug—from under the straw; for they lie on top of the ground around the seed set. * * * The straw forms a protection from the sun and other destructive agents, the same as the earth does when they are grown in the ordinary way."

This method of course commends

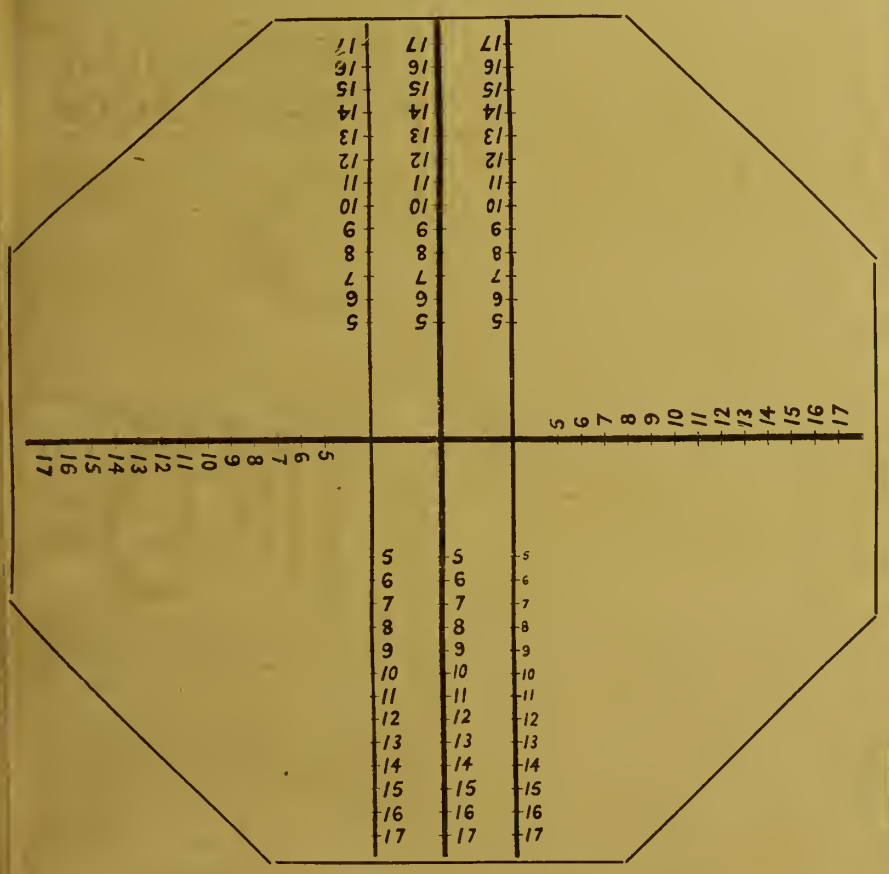
itself only for small scale garden operations, but certainly has the advantages of ease and simplicity. Potatoes so grown can easily be removed from the hill from time to time as they mature.

A method of this kind has been used to some extent in certain parts of this country, where it is known as the "lazy bed." While convenient and economical of labor, it of course is not to be recommended except where better methods of culture are not feasible.



**Outline of Sheet for Fumigation. See Article on Page 171.**

### SHAPING THE TREE.

The modern orchardist plants his trees far enough apart so that the roots and branches will not interlace when the trees have attained their growth. As a consequence the trees are thriftier, they produce as much fruit of better quality and the expense of production is less. Instead of proceeding upon the theory that land can produce hay or garden crops at the same time that it is producing trees, the modern orchardist gives his orchard trees the advantage of all the nourishment the soil contains, thereby hastening growth and securing better trees. He knows that to neglect cultivation of young trees for even a single season will mean halted growth and stunted trees which subsequent attention cannot bring to first-class condition. He recognizes the fact that as a fruit-producing machine a tree is the handiwork of man nearly as much as the production of nature. The modern orchardist does not let nature shape the tree—he shapes it himself with a view to bringing the fruit near the ground, letting in the sunshine and maintaining an even balance. The modern orchardist arranges his buildings, his packing-house and his harvesting appliances with a view to handling the crop economically and putting the fruit on the market in a first-class condition. In this respect he has a very decided advantage over his old-fashioned competitor. He can find the readier market and get the higher price. He reduces his loss of fruit to the minimum and raises the quality to the maximum. He conducts all his operations in a systematic manner, whereas the owner of the old mixed orchard must do most of his work in an irregular and spasmodic way.—Field and Farm.

## THE UDDER.

THE udder in the cow has been developed by civilization to furnish food to mankind. The cow is the foster mother of the human race and has far more to do than merely feed her own calf; she has to feed the babies of the master's household. From being merely a family cow, as the country has filled up, the dairy man has come to find in the cow a source of wealth. Today, a cow must prove her value before she is accepted as a member of the herd. The development of the milk producing quality in a cow is best judged by an examination of the milk veins when she is fresh. The milk veins are blood vessels that carry blood, not milk. These veins show the large amount of blood carried by the milk glands. When the udder becomes gorged with blood, the backward pressure of the venous blood enlarges and gorges the veins into a tortuous network over the stomach and extending forward to the milk wells. There are fourteen to seventeen running to the udder from the heart. The milk wells are the openings in the body where the blood returns to the inner parts, for these veins are on the outside and seem to lie just under the thick skin of the cow If the wells are large enough to let me put the ends of two fingers into them I know that the cow is a good one when well fed. Now the examination of size of the milk well is necessary, for if judgment was founded only on the engorged condition of the milk viens we might be mistaken or deceived by tbe contracted condition of the milk wells not allowing the blood to pass freely into the cow's body. Then large milk veins would not be an indication of the value of such a cow. The great amount of blood required to manufacture the milk of a record breaking cow may be understood when we think of Juliana De Kol producing 1850 pounds of milk in thirty days, or rather more than her own weight at that time, every two weeks while she was fresh. Her motber Juliana has never failed to give many times her own weight since 1900, each year of her life. I am expecting great results from the son of old Juliana, Prince Juliana, as his first heifers are now coming into the milking string. Old Juliana has been the producer of heifers rather than of males, and the first of her calves was Juliana De Kol. The next few were heifers until Prince came. She has a beautiful younger son, now a yearling, that will come in later as a head of the herd.

### Udder Structure.

The internal structure of the gland of the udder is very interesting, but cannot be gone into here without making this article too special for a general agricultural paper. Every one should understand that milk is not formed in the udder, except in small quantities, until milking time. Therefore if a cow is used to being milked at a certain hour, her milk flow starts at that hour, just as regularly as a clock and she will call and call for the milker to come and relieve the gorged condition. When he does not come and the time passes, nature begins to take care of things, so that when he comes later on, he gets less than the customary flow. A few days of irregular milking will lessen the amount very materially. A nervous, frightened cow contracts the muscles of the heart, causing pressure, and the milk flow is lessened. Gentleness and quick easy milking will increase a cow's milk every time. It is that easy deft hand in milking that makes milking a trade. The best men are those that follow it all their lives and do not care to do other work. When a milker does all sorts of farm work he will soon have his hands in bad shape for handling the cow's udder properly. Thirty cows make a California string, and when a man milks that many and attends to the milk he has enough work for twenty-four hours.

### Fleshy Udders.

The udder should be large. I believe the largest on record was over six feet around when congested with the milk material before milking time. A fleshy udder will be as large after milking time as it was before, while a good udder will milk down into a slack form and be soft and yielding to the touch. While the udder is supplied with large veins that completely circle it almost like a cord around a bag of pudding, each quarter is supplied with its own separate gland, and this separation makes it possible for one quarter to be caked and inflamed and lost completely, while the rest may remain in good order and give milk. Nature often compensates, and the udder crippled will give nearly as much milk as though complete, by the other quarters taking on greater capacity and yielding more milk.

### Obstructions.

Sometimes there will be one teat that will not milk as easily as the rest, giving a small, weak stream of milk. These cases should be attended to, for often a little hurry in not milking out the quarter clean will produce congestion and a case of garget will ensue that could have been prevented if the milking had been to the last drops. Then I have had a couple of cows that had one teat that splattered the milk over everything when milked. This was caused by an obstruction half way down the teat duct. There are small lancets that come cased in a milking tube intended for the cutting of these strictures. Before using these instruments the cow should be well secured, by first passing a rope from a strong halter around a post in the fence, then bring it down around her body, and pass it around her front leg and back again, around the fence post and out again, around her body and back again around the post, then over her back, and around the hind leg and then down again around the second post of the fence. Let a man hold the loose end in his hand so that

When writing advertisers, mention Cultivator.

it can be let go of quickly if the cow struggles too much. This will hold the cow while the teats are cut. The little instrument is greased well and introduced until the obstruction is felt, when it is quickly cut by pressing out the lancet. The tube is turned and cut again at about one quarter way around, and this is repeated until four cuts are made. The lead teat distender is introduced and left in place until next milking time. As it is rather troublesome to milk a cow and introduce these lead probes when the milk flow is great, we usually leave it until the close of the milking period. It is better to use a milking tube and to tie the cow for the first few times, as the place cut is sore at first. A cow is easily spoiled by working with her when you do not have her completely at your mercy by tying her up with a good stout rope. It requires much patience to work on an animal when you hurt it, as it cannot be convinced that you mean it for its good, any more than the children can be convinced of that old fairy tale that "It hurts Mother more to whip you than it does for you to be whipped." Do not try this on either cows or children if you wish to secure good results.—M. E. Sherman.

## FISHY FLAVOR IN BUTTER.

Buttermakers in general have long suffered heavy loss from fishy flavor, a well-known depreciating factor in the butter trade of different countries. It is not uniformly present, but occurs more frequently in some countries than in others. For example, it is much more common in butter from Australia than in the Danish product. In the United States it is prevalent in certain sections of the country, especially in the newer dairy localities, and one such region is known to commission men as the "fishy belt." The cause of this trouble has been a mystery and butter experts have been at a loss to account for its appearance, although many theories have been advanced. Since 1905 the Dairy Division of the Bureau of Animal Industry has been working on the problem, and its investigations have just been reported by L. A. Rogers, who sets forth his findings in Circular 146, which may be obtained on application to the Bureau of Animal Industry, Washington, D. C. It is believed that his conclusions regarding the cause and prevention of the trouble will be of practical value to buttermakers.

Of the undesirable flavors of butter the various oily flavors may be classed as the most objectionable and troublesome. They range from a slight suggestion of oil to a strong flavor of machine oil. In the latter case the inferior quality of the butter becomes evident even to the indifferent consumer. Fishy flavor, which is one of the most common of the oily flavors, gives to butter a peculiar oily taste suggesting mackerel or salmon. Butter is frequently described as fishy which is merely oily or otherwise off flavor, but the typical flavor of fishy butter is never mistaken for any other.

While many things connected with the butter-making industry have been ascribed as the cause, Mr. Rogers is of the opinion that fishy flavor is not produced by the action of any one factor, but so far as he has been able to ascertain the immediate cause is a particular substance produced by the oxidation of one of the combinations of the acid developed in the ripening of the cream. In other words, it is caused by a slow, spontaneous, chemical change to which acid is essential and which is favored by the presence of small amounts of oxygen.

It has been a generally accepted theory among buttermakers that sour cream made the best butter. This idea is reversed by the investigations, which bring forth the conclusion that butter made from sweet cream does not contain the elements that go to make fishy flavor.

In all the experimental butter made in the last three years there has been no trace of fishy flavor in that made from pasteurized sweet cream churned without the addition of a starter. In butter made from pasteurized cream with starter added but without any subsequent ripening there had been no fishy flavor, with one or two doubtful exceptions. On the other hand, many lots of experimental butter made from well ripened cream developed marked fishiness.

It is evident, therefore, that there is a direct relation between the acidity of cream and the development of fishy flavor in the butter. However, as the work progressed it became apparent that the acidity, although having a determining influence on fishy flavor, was not the sole cause. With this factor controlled it was impossible to make butter with any certainty that it would become fishy. Frequently butter made from cream with a high acidity showed no trace of this flavor.

It was found that overworking the butter increased the tendency to fishiness, and this flavor could be produced with reasonable certainty by overworking high-acid butter. All butter contains considerable quantities of air, and this is increased by the working, thus producing conditions more favorable to oxidation.

Fishy flavor may be prevented with certainty, says Mr. Rogers, by making butter from pasteurized cream, without ripening. The addition of a starter to pasteurized sweet cream without subsequent ripening improves the flavor of the fresh butter without adding enough acid to cause fishiness. Pasteurization of sour cream will not prevent the development of fishy flavor.

---

Tulare boasts of corn stalks seventeen and a half feet high.

## LIP AND LEG DISEASE OF SHEEP IN WYOMING.

Owing to the presence of an infectious disease known as lip and leg disease or necrobacillosis of sheep, the Secretary of Agriculture has ordered a quarantine, effective August 12, on the counties of Fremont, Natrona, Converse, Weston, Crooks, Sheridan, Johnson, and Big Horn, in the State of Wyoming. Sheep that are affected with this disease will under no conditions be allowed to be moved interstate from the quarantined area. Sheep that have been exposed may be moved for stocking or feeding purposes after one dipping under Government supervision, or they may be shipped interstate for immediate slaughter without dipping, under certain restrictions. Healthy sheep that have not been exposed may be moved interstate from the quarantined area only when accompanied by a certificate of inspection issued by an inspector of the Bureau of Animal Industry.

Lip and leg disease is caused by a germ known as the necrosis bacillus, and is marked by an ulcerative condition of the legs, muzzles, and lips. Other parts may be likewise affected. Sheds, feed lots, corrals, or pastures become infected with the germs, which enter the tissues when the mouth or leg is injured by briars, stubble, rough forage, etc., and set up disease.

Treatment of this disease is very satisfactory if begun in time and applied energetically. It should not be deferred, as better results will be obtained by attacking the outbreak as soon as discovered than can be expected if the disease is permitted to spread among the band or to penetrate deeper into the tissues of the affected parts. One of the first steps to be taken in the treatment is to separate all the sheep that are in any degree diseased from those that are healthy. Large flocks should be dipped in one of the cresol or coal-tar creosote dips permitted by the Department of Agriculture for the official dipping of sheep, the dip being used at a strength one-fourth greater than in dipping sheep for scabies. When only a few animals are to be treated the same solution may be used as a local application.

---

A large scheme which is said to be capitalized at a million dollars is rumored to be hatching for the purpose of irrigating land in the neighborhood of Elsinore.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

## GROWING PEANUTS AS A GARDEN CROP

THE peanut thrives only in warm weather yet its season of growth is short enough to permit of maturing a crop in the same length of time needed to grow and ripen ordinary beans, and its requirements in the way of soil and temperature are very much the same as those necessary for the success of beans, so where the latter are a reasonably sure crop, the peanut may also be counted on to do well.

If every one who has a little plot of ground at his disposal could be persuaded to plant a few hills by way of experiment this year, we could safely count on the majority of "experimenters" making peanuts a part of their garden products. Anyone can get both pleasure and profit out of a few bushels grown for home use, and some to give away or sell to friends.

The nuts of commerce have gone through various processes before the roasting and shelling, but they taste no better than those cleaned and prepared for eating by hand, and the pleasure of watching their development from the time of the first tiny pea-like leaves through the different stages of growth till the nuts are ripe, is worth a great deal to the lover of all forms of plant life.

If peanuts are to do well the soil must be of a loose loamy nature, a sandy soil made rich with fertilizers is perhaps the best, but clay soil, if full of humus, will do. The reason for this is that when the bloom of the peanut drops, the ends of the flower stems which are the nucleus of the nut seek to bury themselves in the soil and unless it is soft and loose these stems cannot penetrate the surface and thus they become blighted. So next to having loose soil to begin with, it must be kept in that state by frequent cultivation until after the blooming period is past.

Whether growing peanuts as a field or garden crop a liberal application of air slaked lime or of land plaster should be given, and a commercial fertilizer containing 8 per cent potash and 8 per cent phosphoric acid should be applied at the rate of 600 to 700 lbs. per acre, or broadcast before seeding 350 lbs. acid phosphate and 300 to 350 lbs. sulphate or muriate of potash. No nitrates are needed, as the peanut, like all leguminous plants, can get all the nitrogen it needs from the air.

Peanuts should not be planted till the ground is warm and all danger of frost is over. The ground should be plowed and well fined, and if intended for horse cultivation rows should be made as far apart as for corn, and the seed planted from one to two inches deep, about eighteen inches apart in the row, two nuts to a hill. If planted in the garden the rows may be far enough apart to walk between when hoeing. The seed had best have the shells removed but care must be taken not to break the thin brown skin covering the nut. Plant raw peanuts, of course.

Some growers plant without shelling, and the writer has tried both with little difference if any in results, and would prefer planting the unhulled seed, to trusting the shelling to careless hands.

When the nuts are ripe the vines may be pulled and dried with the nuts adhering. After curing, the nuts, nuts may be stripped off by hand and for home use are ready to roast and eat, while the dry vines may be fed to the cows and horses.

There are several varieties of the peanut, but for the individual who grows only an experimental patch any variety will fill the bill. The bunch varieties are more easily cultivated and may be planted closer together than the running varieties. The Spanish peanut is one of the best of the bunch sorts, the nuts being very sweet, though small, while the Jumbo is a good kind, when the branching variety is chosen.—Successful Farming.

## PRUNING STRAWBERRIES.

Careful experiments have shown that vigorous fruit buds will not form in the dark. A large isolated plant drops its leaves out in all directions so the sun can shine on the crown or center, and the buds on such plants are very much more stocky and perfect than on those which are crowded so thickly together that their own foliage is closed in, or if the leaves of other plants fall over the crowns and shut out the light.

The great mistake growers make is to allow runners to form and make foliage in abundance, and then cut it all off at once. This destroys the balance between roots and foliage, so that the plant is thrown into a congested condition that induces rust and other fungi which always attack weakened roots. The runners should be pruned off before leaves begin to form and then the growth proceeds in the new crown naturally and leaf and root are equal.

My favorite way of growing fine fruit, of what people call medium sized varieties is in the hedge row, that is, one plant wide and as close as the foliage will admit. Prune off the runners as soon as they appear by attaching a rolling cutter to the cultivator, and thus do the double work with the same labor.

Those varieties designated as extra large I should grow strictly in hills provided always that the ground was very rich to cause them to stool up largely.

On poor soil I should let some runners form, but would never let any strawberry go without close pruning. —Western Rural.

If you have not done so already, give your lawn and plants a good feed, a brand of good commercial fertilizer which is always free from weed seeds for the lawn, and which for this reason alone is vastly less expensive in the end than dairy or stable manure. For trees, shrubs and flowers in the garden both kinds are necessary for the best success. If one-half the water were used and two or three times more fertilizer than is generally applied to lawns and gardens, the cost of maintenance of both would be little, if any, more than is the case by the methods now generally practiced, and the results infinitely more satisfactory.—Pacific Garden.

See if there is not a profitable local market for some of the fruit and vegetables you are raising in the home garden.

# Eucalyptus Seeds

In large or small quantities, 33 kinds to select from. Write for free pamphlet "Eucalyptus Culture." # The Ornamental Garden

### SPADING FOR FLOWER BEDS.

FOR flower beds or borders and for early vegetable beds, the best means of breaking the soil is with the spade, says a writer in the Journal of Agriculture. The good gardener must thoroughly understand garden tools. He must he an artist in the use of the hoe, rake and spade. And we might add here that there is more honor and profit—not counting personal pleasure—in being ahle to effectively handle these tools than in accomplishments popularly considered of higher worth. The good gardener becomes a true artist, producing new forms of heauty and harmony equal to those of the painter, sculptor or musician. The landscape gardener hecomes an artist of the highest school and he who beautifully and harmonlously decorates the home grounds and exterior surroundings of the home is a great a benefactor to his race as he who creates interior decorations.

Spade the soil deeply. As you spade work into it manure or other fertilizers that have been placed on the surface. Thrust the spade into the soil the full depth of the spade-blade, lifting and turning the soil in the same operation. Work each spadeful of soil with the spade to a fine consistency as soon as it is turned. Leave no large lumps below, but make all fine and of even texture.

If the land is somewhat poor or if the suhsoil is stiff and heavy, it is a good plan to shovel out a trench from one to two feet deep. fill in the hottom with stable manure, old shoes and hones, wood and coal ashes and a variety of organic refuse. Shovel upon these the last and poorest soil that was taken out of the trench, to the depth of three or four inches. Upon this place a layer of finer and more decomposed manure, then completely refill the trench. This will make a plant bed in which flowers or vegetables can find abundant food for large development and it will remain fertile for many years.

After the hed has heen spaded and worked down with the spade as the lifting and turning were done, apply the rake. Use a heavy steel-toothed rake that will dig down and pulverize the soll. The object in working down the soil is to make it fine and firm. If the soll is very dry, walk on it as the raking is helng done, making the weight of your body compact the soil. The compacting brings all of the soil particles into close contact for establishing free upward capillary movement of soil moisture. Also, in fine, compacted soil seeds will germinate and roots grow hetter than in loose soil where there is poor moisture cantact. Allowing a freshly spaded hed to settle for a few days hefore planting is often a good thing. If a rain intervenes, so much the hetter.

---

One can greatly increase his numher of plants of heliotropes, carnations, pinks, etc., hy pegging the shoots to the ground and covering lightly with earth, leaving them attached to the main stem until they take root, which takes hut a short time, after which they may he removed to bloom elsewhere if desired.

Old tin cans can be made of great service in setting out flower bulbs. Punch a few nail holes in the hottom, and hury one in the ground hy each bulb. In watering them fill the cans with water, and it will gradually soak through to the roots, where it is most needed, keeping them constantly moist.

Among the Pines.

---

It is asserted that no attempts toward grafting plants on others which do not belong to the same natural order have been successful. Generally speaking, varieties succeed best on varieties, species on species, or species and varieties on allied genera. The fine double camellias will not grow from cuttings, but are propagated by grafting upon the single kinds which readily do so. Many evergreens may be grafted in the ordinary way, hut the pines only succeed with herbaceous grafting.

---

In spraying for insect pests remember that you have two kinds of insects to combat; those that chew their food and those that suck up the juices of the plant. The former may be reached with the poison that they will consume in eating the foliage; the latter must he treated with a spray that reaches the insect, closes its pores and stops its breathing, or destroys the tissues of the insect.

---

Keep the orchard trees headed low. By so doing there will be less sun scald. More trees per acre. Fruit is more easily picked, sprayed and thinned.

**Imported Bermuda Onion Seed**

Our Bermuda onion seed is the finest Teneriffe grown stock gathered from select large bulbs. We import it ourselves, direct from the Canary Islands, and we thoroughly test it for perfect germination before we offer it to our trade. If you intend to grow onions this season, it will pay you to buy your seed from us and get the advantage of our direct importing and scientific testing. We have an import shipment due here August 20th. Orders should be placed now.

White Bermuda Seed, oz. 25c; ¼ lb. 75c; lb. $2.50.
Red Bermuda Seed, oz. 25c; ¼ lb. 75c; lb. $2.25.
Crystal Bermuda Seed, oz. 30c; ¼ lb. $1.00; lb. $3.50.

**Winningstadt Cabbage Seed**

For August and September sowing the Winningstadt Cabbage is unquestionably superior to all other varieties. The hearts are firm, full size and of very fine delicate flavor. The crop comes in for cutting very early in the spring. Our seed is all French grown and we carefully test it for fertility.

Oz. 20c; ¼ lb. 60c; lb. $2.00.
Special prices on larger quantities.

**Aggeler & Musser Seed Co.** 113-15 No. Main St., Los Angeles, Cal.

**EUCALYPTUS**

**Rostrata and Tereticornis Only**

This company offers 1,500,000 seedlings of the above varieties for sale for **FALL PLANTING.** We have 5,000,000 seedlings in our large nursery at Tulare, California, the major portion of which are grown for our own use.

The authorities are rapidly coming to the opinion that the Fall planting is the best and we venture the belief that in a short time Spring planting will have become a thing of the past.

Our trees are grown by Prof. D. C. Burson, a noted forester of forty years' experience, which insures the best possible product. Seedlings are inured to all weather conditions and are strong and vigorous trees 10 to 12 inches in height.

WE INVITE THE CLOSEST INSPECTION.

Orders only received subject to prior sale.

## BURBANK CRITICISM.

The adulation which has for the past few years been bestowed upon Luther Burbank, seems to have reached its climax, and direct abuse is being heaped upon the head of the "wizard." And the abuse seems to be going to as great an extreme as the flattery. Perhaps the most severe of these criticisms has come from the Pasadena Gardeners Association which passed resolutions condemning some methods which have been employed in the disposal of the Burbank products. These were unanimously passed after listening to the report of Mr. Barnhart, a member who had visited and held a long interview with Mr. Burbank.

Possibly this is deserved, but we do not believe any material good can be had by such resolutions. The Cultivator has never been among the hysterical in proclaiming the greatness of the work accomplished by Mr. Burbank, because it has believed that only years of trial could bring judgment and award proper praise. Many of his introductions and products have been placed upon the market before their worth could be tested, and buyers of course feel much bitterness when they think of the long price paid and the short value obtained. If any criticism is due Mr. Burbank, we think it is along this line, but as to taking from him merit due, the judgment of this generation can have little influence.

Beyond all contention Mr. Burbank has produced some things of value. We may refer to the potato which he produced in his youth. True, this was not done as the result of definite work in hybridizing or selection, but more through accidental production from a potato ball picked up by the boy and cared for. He must be given credit for doing the simple thing in a simple way and bringing to perfection the potato which has made millions for the producers of the country especially those of the Pacific Coast. In the flower line, his Shasta daisy has proved its worth, and has gained such a hold on gardeners as no other recently introduced flower. Regarding this "creation" it must be admitted however, that German florists catalagued almost the same flower more than a score of years ago.

Among more recent efforts, though not yet fully tested, we might mention the Formosa plum. We believe this has a great future and will bring enough glory for one man.

True, when one sees the statement, which it is asserted Mr. Burbank made, that his work is of more importance than that of all the United States experiment stations, or that, "Luther Burbank has introduced a rhubarb which he flavors at will with strawberry or raspberry," which he quotes with apparent approval over his own name, it must be confessed that one hesitates as to whether it is proper to simply grin or to retire with a sick stomach. But:

It seems to the Cultivator that the unfortunate feature of the whole Burbank mania lies in ignoring merit in many others equally as worthy or possibly more so. If the Pasadena gardeners will take up the investigation of these meritorious efforts and place the laurel where it belongs, it will lead to more recognition of good work. For instance, an old veteran in the work, Dr. F. Franceschi of Santa Barbara has brought to this state plants from all parts of the world which have wonderfully enriched it, we believe to as great an extent as any man, even including Burbank.

George Roeding of Fresno deserves credit for putting fig culture on a commercial basis which it would not have occupied had not his energy been thrown into the work. Garey gave us the Eureka Lemon, Sexton the softshell walnut, while T. A. Hatch and the late Felix Gillette labored long in the almond industry. The late John Rock should surely be remembered as a great factor in our state horticultural history. The late A. J. McClatchie's name is worthy of enrollment as a reminder of one who possibly more than any other, made known the real merit and commercial possibility of the Eucalyptus.

These names make only a start on the list which might well grace a roll of honor. The columns of the Cultivator will be a desirable place for establishing such a roll.

## A GOOD WORK.

Without question the wealth of this country has been vastly increased by the work of the Department of Agriculture. The large appropriations made for it sometimes almost stagger people who do not know the work being done, but to those who have watched closely in the last few years, it is apparent that Congress is none too liberal with the funds of the nation. To California has been furnished one of the most striking examples of this benefit, perhaps because of the condition here which has been brought about by the most perfect system of co-operative fruit marketing in the world.

While passing through California recently, G. Harold Powell, in charge of the field investigations of the Bureau of Plant Industry, called at the Cultivator office, and in the course of conversation remarked that the experiments in citrus shipping and citrus decay owe a great part of their success to the co-operation of the great citrus organization with the workers of his department. We had supposed that the investigations of conditions affecting eastern apple shipments and the possibility of securing a more marketable apple for the export trade, had been more successful or had attracted more widespread notice than the western work, but Mr. Powell stated that the Department had been unable to secure there the large co-operation which had been given so readily in California. Here not only large numbers of the individual shippers are willing to aid his work, but he finds in the citrus fruit exchange complete co-operation in a large way, to the extent of supplying him with one car, or a hundred cars if necessary, to treat as he sees fit. This is true at the western end; and he is even allowed a certain control over the cars to their destination.

This is a sample of one of the benefits of co-operation which is usually lost sight of. The outside shipper looks at the season's returns and compares his own with those of a member of the exchange, and sometimes feels a sense of exultation that his own unaided shrewd marketing has accomplished for him as much as has been done by the exchange. But credit should be given to the organization which has saved the industry by just such co-operative movements as Mr. Powell mentions.

It is fortunate these two factors, the Department and the Exchange were brought together to the advancement of the citrus industry.

## FARMERS INSTITUTES.

Mr. J. B. Neff announces additional farmers institutes: Elsinore, August 30, 31; Orange, September 1, 2; Fullerton, September 3, 4; Highlands, September 13, 14; Redlands, September 15, 16; Rialto, September 17, 18.

## MORNING GLORY.

(Continued from Page 171.)

We have had correspondence with many agriculturists in California on the subject, and recently sent a letter to the Department at Washington for further information. This was referred to Mr. H. R. Cox, Scientific Assistant of the Bureau of Plant Industry, who writes us as follows:

**H. R. Cox, Scientific Assistant Bureau of Plant Industry.**

In regard to the control of this weed by the use of spray solutions, several experiment stations have conducted trials along these lines without satisfactory results. The chemicals used in these experiments were, for the most part, iron sulphate, arsenate of soda and common salt. The tops of the weed are killed by these sprays but the underground parts send up new tops at once, so great is the vitality of this pest. After spraying thoroughly for two years at intervals of a week or ten days, the Kansas Experiment Station still found the wild morning glory making considerable growth, which, if left without further attention, would soon have become as bad as ever.

Three successful methods have been employed in the eradication of this weed. One of them is clean cultivation. Many farmers are prejudiced against trying to get rid of the wild morning glory by this means. Very often the plan has not been given a thorough trial. There are few cases in which a patch of this weed cannot be eradicated by thorough cultivation for a year, or, at most, two years. It requires going over the land about once a week during the entire growing season. It is an important matter to use proper implements in this work. Those of the weed knife pattern which cut off the stems below the surface are usually more effective than the implements that have teeth or shovels.

A second plan that has been found successful, especially in the East, is alfalfa hay growing. When a thick vigorous stand of alfalfa has been secured the frequent cutting and the smothering effect of this crop often greatly reduces or entirely eradicates the morning glory in a few years.

The third method is hog pasturing. Hogs are very fond of the underground parts of this weed which taste much like the sweet potato. If, therefore, they are turned on a field of it without having their noses rung or slit they will root the morning glory vigorously, especially if they do not receive much other feed. They can be turned either on a regular grass pasture or the land can be plowed and the hogs then turned in. The latter way probably brings quicker results and is more applicable in California.

Every man must choose a method that is best suited to his conditions. In many cases clean cultivation is the only one that can be followed, but where the other plans can be employed, they are apt to prove effective in the control of this weed. Many farmers are looking for some quick means of eradication that requires very little work. It must be understood that such a serious pest as the wild morning glory necessitates heroic treatment.—H. R. Cox, Washington, D. C.

# Agricultural Notes of the Pacific Coast

## Northern California

Hop picking will begin about August 20 to 25.

Modoc county predicts an immense crop of grain and alfalfa.

Twenty-one cents is now being offered for Sacramento Valley hops.

Table grapes are now being shipped rapidly, but few are being dried as yet.

Ukiah has been sending forward some exceptionally fine Bartlett pears this season.

The big plant introduction garden at Chico will experiment with various citrus fruits.

A mass meeting of the Santa Rosa Viticultural District was held in that city last Saturday.

Yolo County Stock Breeders are making extensive exhibits of their cattle at many fairs this fall.

An engineer of the United States Geological Survey is arranging to study the drainage situation of Northern California.

The Sutter County Farmer says that the crops along the river in southwest Sutter never looked better than this year.

The biggest shipment yet made of deciduous fruits from Newcastle was made this month when thirty-five carloads left town in one day.

Prof. M. E. Jaffa of the State University is investigating through a series of experiments as to the benefits of various feeds for poultry.

Shasta county's pear crop will reach the 300 carload mark which will be the bumper for that county. They will bring growers about $35 per ton.

Farmers at Biggs are securing large storage facilities for their hay until prices are more satisfactory. One warehouse has a capacity of 3500 tons.

The manager of the canneries at Yuba City has invented a canning machine which works automatically and makes the process much more economical.

Over a mile of levee is to be constructed at Shanghai Bend near Yuba City. It is estimated that 80,000 cubic yards of earth will be required for the improvement.

The Diamond Match Co. is building a spur railway which will open up an immense timber supply where it is estimated eight hundred million feet of lumber will be secured.

Reclamation District Number 777 in Sutter county entered suit against certain farmers for collection of assessments which had been refused, and the decision was in its favor.

One firm at Santa Rosa has bought a hundred thousand pounds of hops at twenty cents per pound at the ranch. The same company has offered twenty-one cents for a few small lots of exceptional quality.

More attention is being given to irrigation schemes in western Placer county than heretofore. An effort will be made to establish an irrigation district from Newcastle to the extreme Placer county line.

The city of Vallejo is taking up with one of the first experiments of its kind, in this, that it will plant a large number of eucalyptus trees on 500 acres of waste land near the site of the municipal water works.

## Central California

Hanford is engaged in sending watermelon thieves to jail.

Armona has a large force packing peaches in twenty pound boxes.

Kerman boasts of June sown alfalfa which is doing remarkably well.

Pajaro Valley orchardists are giving a late spraying for the codling moth.

Watsonville has already begun shipping of some of her early Gravensteins.

The Tulare County Fair hopes to have an exhibit from the experiment station.

Some rich land near Tulare is bearing a fine lot of corn this year without irrigation.

The Kings County Raisin and Fruit Co. is building a fine fruit and raisin house at Armona.

Tulare claims that it has the largest co-operative creamery association in the United States.

The California Co-operator is the name of a new paper which is the organ of the California farmers union.

The gathering and drying of Muir peaches is in full blast throughout Kings county and a large crop is reported.

Investigation of the various dairies about San Jose shows the nineteen principal dairies to be in exceptionally good condition.

Wine grape growers are impatient over the fact that the California Grape Growers Association refrains from naming any price for this year's purchases.

The farmers union at Kerman is doing some vigorous work in getting farmers in the surrounding country together in the Kerman Co-operative Creamery.

A co-operative dairymen's association at Dos Palos issues a statement showing that prices paid to producers of that section for 1909 are better than for 1908.

A distribution of twenty-five per cent of the money involved in the old Raisin Growers Association to the total of $76,750 has been ordered. The total distribution ultimately will be about $307,000.

The members of the referee board appointed by President Roosevelt did some of their first work in this state at San Jose in studying methods of fruit drying and sulphuring, making trips through various packing houses.

A Clovis fruit company has sold its wine grapes consisting of about 7000 tons, to the California Wine Co. with the understanding that the price paid is to be as high as that paid by any other concern. The grapes will be delivered at Madera.

William H. Saylor has resigned as secretary of the State Dairy Bureau and has been succeeded by F. W. Andreason, formerly of Humboldt county. Mr. Saylor will remain in the position of chemist which he has heretofore held in connection with his office of secretary. The three inspectors who have been with the board in the past will remain. They are J. L. Starr of Los Angeles, J. H. Severin of Oakland, and W. H. Perrot of Humboldt county.

## Southern California

Coachella Valley is producing some of the finest Bermuda onion seed.

Santa Ana now boasts one of the most complete sanitary dairy barns in California.

Coachella Valley proposes to plant enough egg plant so that during next winter it can ship a carload a day.

The shipments of horticultural products from Fullerton are vastly in excess this year over those of last.

Agricultural District Number 16 will hold its annual fair at Arroyo Grande the week beginning September 20th.

Irrigation Expert Rockwell, of the government service is in Southern California investigating irrigation conditions.

The Farmers Union in the Imperial Valley is securing large additions to its membership and many locals have been formed.

The orange packing season at Highland closed a record of 119,000 boxes of fruit from the Highland Growers Association.

The Angeles Forest Reserve is to be inspected with the idea of determining as to number and variety of forest trees required.

It is reported that Southern California will see a bigger planting of eucalyptus trees this year than last which was the greatest ever.

Orange County bean growers recently held a meeting at Santa Ana to discuss uniting with the Ventura Lima Bean Growers Association.

A grass fire recently swept over a portion of Menifee, Riverside county, destroying a harvester and a stack of grain, besides doing much other damage.

The fruit growers at Rialto are asking the board of supervisors of San Bernardino county for the organization of a new fruit inspection district.

The Imperial Valley cantaloupe season closed much more satisfactorily than last year, and about a dollar a crate is being realized by the producers.

Riverside county supervisors have introduced an ordinance which, if passed, will compell everyone engaged in the fumigation of trees to take out a license.

The Palo Verde country in Riverside county, is harvesting an immense crop of grain this year, being the first large crop that section has ever harvested.

From the larger apricot sections of Ventura county, it is reported that the apricot output will be smaller than was reported early in the season. The fruit, however, is of exceptional quality.

The decree of the court by which the California Development Co. was instructed to pay to the Liverpool Salt Co .$456,000 because of the submergence and destruction of its works, has been reversed.

At the annual meeting of the Highland Orange Growers Association, the following were elected directors for the coming year: G. M. Rose, G. W. Loring, Thomas Hooker, J. W. McCabe, Jr., Dr. E. J. Rohrer (Secretary), E. J. Yokam (Vice-President), Alexis E. Frye (President).

## The Coast

Some great exhibits of apples are being made at the A-Y-P Exposition.

Dry farming is being largely extended in the vicinity of Prescott, Arizona.

Clover is proving remarkably successful in the region of Palouse, Wasington.

Ranchers in Umatilla county, Ore., are receiving as high as $12 per ton for alfalfa.

A stock show will be held at McMinnville, Oregon, September 24th, to October 1st.

A township high school near Lewiston, Idaho, is planning for an agricultural course.

It is estimated that one-third of Benton County, Washington, is now under irrigation.

Hawaii is irrigating sugar cane on a greater scale than any other section in the world.

The Fair Association of Arizona is about to buy fair grounds at an expenditure of $30,000

A rancher near Yuma reports a bunch of Thompson Seedless grapes weighing five pounds.

The University of Arizona is offering a short course in agriculture which will begin September 20th.

Cattlemen of Washington and Oregon feel very bitter regarding the free hide feature of the tariff law.

Time for making entries in the live stock exhibit at the A-Y-P Exposition has been extended to August 20th.

Ranchers near Phoenix are concerned over the appearance of the grasshopper pest in the alfalfa section.

One farmer at Davenport, Washington, has just sold his crop of 25,000 bushels of wheat for 93 cents a bushel.

Lewiston, Idaho, is marketing an immense crop of cantaloupes. The total shipment will be about 40 cars from that section.

Smut fires have already begun in Washington, Colfax reporting a big fire with destruction of machine and entire field of grain.

Hawaiian sugar planters are experimenting largely in the stripping of sugar cane, but so far results are favorable to the non-stripping.

Stockmen have recently leased 100,000 acres in the upper Clear Lake country in northern Idaho, which will be used for grazing purposes.

The Colorado River has encroached upon Yuma to the extent of washing out 110 town lots and moving several hundred thousand tons of sand.

The receipt at Seattle of a thousand bags of corn from the orient is one of the strangest imports which have come to the Pacific Coast for some time.

The government of Mexico is constructing buildings on a large ranch near the city of Oaxaca which will be the nucleus of a large agricultural experiment station.

Hawaiian canneries which have heretofore devoted their efforts almost exclusively to the canning of pineapples, are now investigating as to canning guava jelly and paste and other fruits so as to run the year around.

## For Eggs Next Fall Feed Now

# West Coast Egg Food

Don't make the common mistake of supposing that you can let the fowls get all run down before or during molting and then bring them up by heavy feeding later. You won't get eggs that way. They must be kept in good condition and fed feather producing and egg making food. We know how to make rightly balanced rations for such purposes. That is our business, and we have the best equipped mill for doing it, or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg Food, as good as anybody can make, by using

# EGG MORE

and you will get no unsound grain, no mill refuse and such stuffs, as are in many concoctions called Egg Food. Egg-More is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs if you feed it just a little each day. 25 lb. sack, $1.90; 50 lbs., $3.60; 100 lbs., $7.00. If not kept by your dealer we will prepay freight within 300 miles.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

---

## FOR MOULTING HENS

**Feed**

# MIDLAND

## Poultry Food No. 4

***$1.95 per Sack***

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.

***Petaluma Incubators and Brooders***

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Send for our Illustrated Catalogue.

## Petaluma Incubator Company

**Petaluma, California**

Our General Agents for Incubators and Brooders and Midland Poultry Food:

**Petaluma Incubator Co., Petaluma, Cal.**
**Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles**
**Berrar & Robertson, San Jose, Cal.**

Plant all the sunflower you have room for—the seed heads are fine for moulting hens.

A mating can be continued for seven or eight years without a change.

# Profit in the Poultry Yard

By Mrs. Frank Metcalf

**We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.**

### FALL CHICKS.

EVERY one should raise at least a few broods of fall chicks in California. They will come into laying in February and March, and the cockerels make fine broilers at holiday time.

The main thing to guard against at this time of year, is lice and mites, which are a little more troublesome than earlier. Plenty of garden stuff can be obtained to give chicks green food in abundance. The late hatched chicks seem naturally to feather out early, and how they do grow!

In setting hens at this time of year, especial care should be taken that the nests are free from vermin of all kinds, and well shaded from the hot sun. Plenty of fresh drinking water must be provided during their confinement, and their food should be wheat and a little cracked corn. The chicks may be left for the hen to raise, providing safe coops in which they will be protected from night prowlers are furnished, or they may be taken from the hen and raised in a brooder, fireless or otherwise.

Feed the little chicks good clean chick food for the first few days, with coarse sand in the floors of their coop, and a water cup in which they cannot drown.

My favorite way of watering small chicks is a whiskey glass with heavy bottom, which they cannot well upset, and which is high enough for them to reach with their bills only. Or a good way is to take a pound baking powder can, punch a hole with a nail in one side near the top, and fill with water, then reverse over a small pan or saucer. This may be set up on a board so they cannot scratch dirt into it, or placed directly upon the ground as one wishes. They very quickly learn to upset these arrangements, I find, unless they are up on something, and even then, the lively chicks soon learn to tip them over. A tin cup with a stone in it makes a good drinking cup as soon as they are large enough not to drown in it. Whatever is used, must be kept sweet and clean, and the water renewed very often so as to be perfectly fresh.

If incubators are used, the danger of vermin is, of course, lessened, but unless a hygrometer is used, trouble about moisture is likely to spoil the hatch. As these useful appliances can be purchased and used in any machine, now would be an excellent time to try one.

By either method, hens or incubators, a few chicks hatched now will prove a good investment, and we won't be sorry we have them by and by.—Mrs. Frank Metcalf.

### POULTRY QUERIES.

**Chicks Dying.**

I have had severe losses among my young chickens this spring, for which I cannot find a satisfactory reason. In one lot I set 600 eggs in incubator and hatched 406 chicks. They began to die when a couple of weeks old and in spite of all I could do, they all died but three dozen. I use indoor brooders( positively free of headlice or body lice or mites) in a brooder house with cement floor and runs 3x24 feet, coffee hulls from 1 to 2 inches deep to scratch in, plenty of sand and grit and clean water daily, also granulated charcoal in hopper and feed Midland number 2 in hoppers always accessible, and a regular small grain chick feed, given in scratching material four times daily. Their appetites always ravenous and yet they grew very slowly and every afternoon a dozen or two would become too weak to move around and in a few hours die.

They did not have "white diarrhoea," but their droppings seemed to be covered or surrounded by water, yet the dropping itself seemed fairly firm. Their livers were sometimes spotted (yellow) others very dark and bloody and their galls frequently filled with arterial blood, and sometimes amber colored; sometimes apparently overflowed and staining intestines; their bodies nothing but skin and bones. Is it possible that my breeding stock is the cause of this? Or is there something wrong in my care? A reply to the above will be greatly appreciated by yours truly.—W. C. D., San Jose.

I would like to know what system of brooders was used in this case, for although the symptoms and post mortem almost seem to declare liver complaint there may be something in the method of heating which caused the primary weakening of this promising lot of chicks. The good hatch rather indicates that the breeding stock is in fair condition, so I would not lay the blame there from the report, which, while complete in most respects, leaves one in the dark as to others.

Now, the only way to have the heat regulated in a brooder, is by automatic valves, which means a larger expense than many care to invest in the chicken business, therefore the heating of most brooders is very defective, and while the chicks may seem very warm and comfortable at night after the whole house has been warmed by the sun all day, along towards morning they chill and crowd, thus weakening their vitality and ruining their digestions. Again, they may be too warm in their brooders all night, and the fresh cool mornings which are so invigorating to us, chill them and cause a weakened condition. Unless one has a very good system of heating, it is best to go out to the brooders along towards morning, say at 2 o'clock and see how they are doing. If they are comfortable and spread out like a flock of little sheep on the floors of their brooders, it is safe to say they are all right, but if they become restless, and are either too hot or too cold, a few nights' attention will convince one where the trouble is, and means may be taken to improve conditions.

A brooder should be so constructed that a chick may be at a temperature of 100 degrees if it wants it, or free to move a little farther away from the source of heat at will, yet never be so it can get entirely away from the warm atmosphere necessary to a good night's rest. Under a hen the chick is just as warm as during incubation but has the privilege of putting its head out into the fresh air if it cares to,

but few of them do at night in California, and especially along towards morning. So our brooders must keep them warm enough, yet not overheat them, a very difficult question where the temperature ranges 50 degrees from night to morning.

I believe more chicks are lost from being cold at night than many suppose and there is certainly danger of overheating, also. So, I repeat the only way to be sure they are comfortable, is to get up every night and see for one's self how they are acting.

Now for the liver trouble which was surely present: The watery condition of the droppings indicates congestion of the liver, which the post-mortem confirmed. Any trouble which obstructs the circulation of the blood will congest the liver, cold, over-heating and subsequent chilling, or an excess of starchy matter in the food. A teaspoon of castor oil to each four chicks, (a month old, decreasing the quantity according to age), should be mixed into an appetizing mash of some kind and administered at the first symptom, which is a watery discharge, usually. Then give them all the finely cut clover you can get them to eat, and feed green cut bone or fresh meat rather than so much dry mash, with cracked wheat for a month. My own favorite corrective is raw eggs mixed with wheat bran once a day, with all the finely ground eggs shells I can find to mix in. Also chopped onion with the clover, but no white wheat bread or flour mashes, which are too starchy for the little patients. Instead of the coffee hulls, I should try to get the waste from a haymow or feed market, as this contains many seeds and particles that are relished by the chicks, but not from a barley haymow, by any means. The waste from alfalfa is the best.

There are some breeds of fowls that are much more apt to over-eat than others, Barred Rocks being usually the greatest eaters, and most prone to liver trouble in consequence.

Better to feed "little and often," rather than let them gorge themselves if they are so inclined, but thousands of chicks are raised successfully with a hopper of feed in reach at all times, and one feels so much freer in mind, if one knows the little fellows are in no danger of starving if one is delayed by other duties.

Some chick foods contain a large percentage of oatmeal, which I have found dangerous to young chicks, causing bowel trouble and irritation of the alimenary canal. Many people will not use a food containing a particle of oat meal, if they know it.—Mrs. Frank Metcalf.

### AN OHIO ROOSTER LAYS EGGS.

Petaluma incubators have started to revolutionize the poultry business in the East, judging from the published report from one of its customers in Eaton, Preble Co., Ohio, on March 24th, 1909.

That farmer living northeast of Eaton hatched a fowl. It to all appearances is a rooster of Black Minorca species. In the past three weeks this rooster has layed eleven eggs. The eggs have been exhibited over the community and they are very odd, there being no two of them of the same shape or size. One looks to be at miniature ten-pin; another is the shape of half a moon; one like a stuffed sausage, and still another looks like a greatly enlarged capsule.

The fowl is healthful and the occurrance has produced a great deal of merriment, none believing the story until the goods were produced. None of the eggs contain a yolk.

# DIP YOUR HENS

**When? - - - - - - Now**

Molting time is the best time in the entire year to dip your fowls.

Kill all the lice and vermin and let Biddy start in the new year in a good healthy condition in her new coat.

**In What? -- Creolium**

CREOLIUM is a coal tar preparation and and is the greatest germ destroyer and disinfectant known to the poultryman of the present day.

It is Anti-Toxin and Non-Poisonous.

The PACIFIC POULTRY COMPANY has used CREOLIUM and nothing else for years as a spray for the houses and a dip for the fowls, to keep their thousands of birds clean and healthy. What more testimonial or guarantee could you ask?

It is not expensive for in nearly every instance it is diluted to one part CREOLIUM to 50 parts water, sometimes even more.

It is an indispensable remedy for the stable and among the cattle.

PRICES AS FOLLOWS:

Quarts, $1.00 Gallons $2.50
½ Gallon, $1.50 5 Gallons $12.00
Special rates on large quantities.
Mail orders filled promptly, if money accompanies order.

**The Pacific Poultry Co.**

**are sole agents in Los Angeles County for this product, and it is for sale at their plant in Inglewood, also at their Los Angeles Office, 416 Chamber of Commerce Bldg.**

**Coulson's**

# No 3 Condition Powders for Poultry?

A first-class tonic and conditioner like ***Coulson's No. 3 Condition Powder*** is of great benefit to the chickens, especially when used at this time of year.

***Coulson's No. 3 Condition Powders*** will prevent diseases, by keeping the flock in a thoroughly healthy condition. By the same means it will keep them laying longer into the molt, and their healthy condition will enable them to molt quickly and commence laying at an early date. As it contains no injurious stimulant, it can be used with perfect safety at all times and for this reason is fed in large quantities by numerous poultrymen.

**It Contains No Cheap Filler**

In buying a bucket or sack, therefore, every pound is of value to the chickens, and will give you large returns for the money invested.

For sale by all dealers or at factory.

**Coulson Poultry & Stock Food Co.**

# Irrigation and Forestry

### IRRIGATION EXPERIMENT AT DAVIS.

A test of the efficiency of various types of ditch linings in preventing seepage is now being made by the Federal Department of Agriculture at the State Farm at Davis. The results of these experiments are not yet ready, and may be given out only in the form of Bulletins; but a brief account of them may be of interest.

The test ditches are uniform in size, and of the following dimensions: Depth 2½ feet, side slope 1½ on 1; bottom width 2½ feet; top width 10 feet; bottom length 42½ feet; top length 50 feet; surface area, 578 square feet.

Two of these test ditches are lined with a 2½-inch coat of concrete, of different compositions; one containing 1 part lime to 2 of Portland cement, and 1 part of this mixture to 7 parts gravel; the other consisting of 1 part cement to 4 parts gravel. Cost as follows:

Lime concrete: Labor, $16.50; material, $25.00; total cost, $41.50; per square foot, $0.072.

Concrete: Labor, $13.50; material, $28.00; total cost, $41.50; per square foot, $0.072.

One lining consists of brick dipped in hot asphalt, laid flat, and then flooded with hot asphalt:

Brick and asphalt; Labor, $12.37; material, $25.00; total cost $37.37; per square foot, $0.064.

Burlap coated with road oil, and later covered with 1-inch layer of soil, cost $0.018 per square foot.

Clay puddle, 2½ inches thick: Labor, $7.00; material, $3.00; total cost, $10.00; per square foot, $0.0175.

Neat cement, ¼-inch coat, formed by sprinkling dry cement on the moistened soil surface of the ditch: Labor, $2.50; material, $3.75; total cost, $6.25; per square foot, $0.011.

A coat of alkali puddle put on like the clay puddle cost $0.025 per square foot; and a coat of road oil, at a cost of $0.008 per square foot, was applied to one ditch. One ditch was left without lining.

This test is being made on the University Farm at Davis, where there is a station of the Weather Bureau from which corrections can be made. The results will be valuable to all who use irrigation ditches.

# A Modern Pumping Plant

## A Well Arranged Irrigating Plant on Rancho Venturilla, Rivera, Cal.

The beautiful Southern California view here presented is on Rancho Venturilla, the residence of Dr. J. Allen Osmun, situated in the San Gabriel Valley near Rivera and near the line of the Pacific Electric Ry. from Los Angeles to Whittier.

The smaller picture gives a good idea of the modern source of water supply, the drilled well with the pumping plant as a necessary appurtenance of the profitable farm.

This ranch consists of a little over 100 acres of fine soil under a high state of cultivation, set out principally to walnuts, 60 acres in oranges and some alfalfa. It may be pointed out as a well developed type of the well equipped profitable farm which has attracted large investment in property of this class in Southern California.

This property was entitled to gravity water of 200 miners inches flow from the Walnut Growers Irrigation Co., and from the Arroyo Ditch & Water Co., 150 inches, which is an abundant supply and at the same time one of the cheapest supplies in the State, as the rate from one company was twenty cents an hour and from the other twenty-five cents per hour for the full head of 150 or 200 miners inches. The inconvenience of taking water at the particular hour, day or night, caused Dr. Osmun to spend about two years investigating 50 to 60 pumping plants covering all methods of raising water, with the idea of obtaining the best scheme for his own water supply.

Besides the inconvenience of seeing that his men were on hand at the stated hour, for example two o'clock in the morning, to take care of the head of water, Dr. Osmun estimates that by doing his irrigating in the day time he does the same work with half the help, also that his men not having to work nights can keep his teams busy during the regular daylight hours; and further that having water at the proper time aids the financial results of cultivation to a very material degree. Being active President of the Whittier National Bank, one must admit that Dr. Osmun is capable of passing on the financial merits of the individual water supply under his conditions without error, and he states emphatically that the accrued results far more than pay the interest on the investment in the pumping plant. After making the investigation the liberal representations of F. J. Kimball induced Dr. Osmun to install a Twentieth Century Air Lift plant. Accordingly Mr. Wright of Downey was engaged to drill a 12-inch well to a depth of 270 feet, in which the water raised to within 13 feet of the surface. The contract with Mr. Kimball called for the delivery of 125 M. I. out of the well with a 25-H. P. distillate engine and air compressor. At the first test 125 M. I. were pumped and as the flow has cleaned the well the water has increased to 160 M. I., giving sufficient suppply for 500 acres if pumped only 10 hours a day. During the two years this plant has been in operation there has been no money spent for repairs or sand pumping.

Dr. Osmun, speaking of the installation says: "The plant has not only come up to the calculations but has exceeded my expectations. The first cost fell about $250.00 below the estimate furnished by Mr. F. J. Kimball and it is a rare case where a hydraulic engineer does the work within the estimated cost. It costs me a little more per hour than the gravity water, but when the water company assessments are considered to cover river dam maintenance, etc., my pumped water is cheaper, and of first importance to me, is that I have the water when I want it, as long as I want it, and my pumping machinery is never out of order to interfere with this arrangement."

In the picture the engine house is shown in the back ground about 12x36. All the working machinery is here under cover. The gasoline engine is arranged to start with compressed air, and is belted to a two cylinder enclosed crank case compressor of the latest make. The air goes from the compressor to a small air receiver in the engine room and from there is taken down the well; the lower end of the air pipe being screwed into the 20th Century Air Lift. The discharge pipe bringing the water up out of the well is screwed into the top of the Air Lift, both pipes being inside of the 12 inch casing of the well.

The round tank shown is attached to the top of the discharge pipe with a retaining deflector inside to prevent the water from spouting over the top of the tank. The stream flowing into the cement weir at the time this picture was taken was about 150 M. I.

Dr. Osmun says there are many farmers who would profit by using a pumping system of this kind and he will be glad to answer inquiries from such of our readers as may be interested.

# General Agriculture

### BEET AS A ROTATOR.

WHEN a farmer smiles a "you-can't-stuff-me" smile when the suggestion is made that he raise sugar beets not only to help out his income, but to prolong the life of his farm, one often wonders how this farmer accounts for so many European countries producing their own sugar at a cost greater than to import it. Probably he doesn't try to account for it. But the fact remains that Europe learned long ago that even with her cheapest help she couldn't compete with the peon labor of the tropical countries. Holland owns the Island of Java, but she buys almost no sugar there, notwithstanding that it produces 1,000,000 tons. France gives only the slightest reduction to colonial sugars. But Europe didn't give up making it because she could buy it cheaper. Duty was put on imported sugar to protect the home trade—not to insure an income to the few men directly connected with the industry—but because of the great good done to the land—a benefit which covers a long period of time. This means a slight increase in cost to the consumer of the sugar, but lessens his expenditures very materially on other products.

By protecting her sugar industries Europe has given opportunity for the investing of $500,000,000, an amount, which returns to the people $400,000,000 annually, a sum which would otherwise be paid out to foreign countries In addition to this $150,000,000 is derived from the surplus which is exported.

But the principal reason for encouraging the home raising of the sugar beet is as a crop rotator. Used in this way it has reclaimed much worthless land and made good land much more valuable for crop producing purposes. This argument has often been advanced, but most everyone seems to think it untenable. However, in Germany, wheat, barley, rye, potatoes and peas were grown on land just following beets and the yields per acre were increased in the following percentage: Wheat, 24 per cent; barley, 25 per cent; rye, 15 per cent; potatoes, 102 per cent; peas, 86 per cent.

The item of potatoes is a very suggestive one and indicates the future possibilities of the Salinas Valley. Land constantly grown to one crop soon deteriorates. If Blanco, Chualar and all sections primarily interested in potato raising would rest their land by a two-years' rotation with the sugar beet the next few crops, after a return to potatoes would be astonishing.

There is nothing supernatural about this. Thorough cultivation of the land affects not only the growing crop but those of the following year or two. To grow beets the land is plowed deeply and carefully, and thorough cultivation is given during the growing season. The plowing is deeper than ordinary by five to ten inches and just so much more land becomes available for future plants, as most crops can derive moisture and nutriment only to the depth of plowing. Repeated plowings to one depth leave a hard-pan through which it is almost impossible for roots to penetrate. This is broken up by the plowing for the beets.

In the case of the sugar beet numerous small fibrous roots will penetrate many feet down and to the sides, breaking a way through hard, resistant soils.

When the beets are dug these roots are broken off and by rapidly decaying replace humus in the soil, and the humus is the life of the land. In the same way the tops also contribute humus.

The holes made by the tiny rootlets are left and the roots of future crops will follow these paths, thus reaching increased stores of available food. So there is nothing supernatural in regard to the way the beet improves the soil.

One more reason, of a more general nature, showing the value of the sugar beet is in remote sections—particularly arid regions—where long hauls and heavy freight rates prohibit the shipping of low-priced, bulky commodities. Here the bulky beets can be turned into sugar and the $5 per ton is turned into $100 and shipped to a market consuming hundreds of thousands of tons of sugar and capable of handling a vast amount more. Verily, the United States can and should be her own Sugar Bowl.—R. L. Adams, Director Experiment Station, Spreckels Sugar Co.

### UTAH USING CARE.

The California State Board of Trade is in receipt of the following letter from the State Inspector of the Horticultural Commission of Utah. "I beg to call your attention to Section 14 of the new horticultural law, which bars, from Utah markets, fruit showing evidence of the work of the codling moth, and San Jose or other scale insects.

We feel that you are deeply interested in this matter, inasmuch as there is considerable fruit coming from your state into our markets. It is not our desire in executing this law to work any hardships on the fruit growing interests and as there are a number of markets which will take this class of fruit, this market can be avoided. The law will be rigidly enforced here, and no doubt by giving this publicity among your fruit growing interests, you will save considerable financial loss to any shippers who might unknowingly send fruit infested here.

It is our desire to co-operate with all shippers, and assist them in every way possible, and thus avoid loss through condemnation.—(Signed) J. Edward Taylor, State Inspector."

The Section 14 to which reference is made reads in part as follows: Horticultural Law of Utah Chapter 48 Session Laws of 1909.

"Unlawful to Sell or Offer for Sale Diseased Fruits. Section 14. "It shall be unlawful to sell or dispose of or offer to sell or dispose of or to have in one's possession for sale or barter, any fruit which is or has been infected with San Jose scale, or other scale insects, or the larvae of the codling moth, and the fact that any fruit bears the mark of any scale, or is worm eaten by the larvae of the codling moth, shall be deemed conclusive evidence that said fruit is infected within the meaning of this section; and the state and county inspector and the deputies are hereby given power to seize and destroy such infected fruit whenever they shall find that the same has been packed, sold, shipped or offered for sale, or is being held in any warehouse, store, salesroom or other place for the purpose of being sold, bartered, shipped or exposed for sale or bartered.'"

### FARMING IN NORTH MAY BE PROFITABLE.

That farming in Alaska can be made to pay is the opinion of many agricultural experts who have done considerable experimenting on their own account, and have verified their work by the Government experiment stations. The consensus of opinion is that in any of the big valleys farms will prove profitable, inasmuch as there is gradually growing up a market for farm products owing to the rapid extension of transportation facilities.

It has been observed that many of the methods of farming in progress in the United States and Canada will have to be considerably modified because of the difference in the seasons. Above Sitka the ground rarely thaws completely out, frost being found at a depth of 12 feet or so. This, however, has little effect upon the growing of grains, fruits and vegetables. The Department of Agriculture at Washington has issued a report that suggests to the farmer taking up new land in Alaska that he should be content the first year to clear and break his land, and put off his seeding until the following spring, as in many instances it will be found that a surface moss covers the soil, and this must be removed and burned. The report is encouraging, however, and a perusal of it would indicate that a man will find little difficulty in growing successful crops during the four months' farming season. Reports on stock raising are most encouraging, several instances of stock being turned out to winter themselves having been proved successful.

### Ar·bian Alfalfa.

Having noted your references to Arabian alfalfa, I wish to know whether it would do well in the Turlock district; also where may I get seed; about what is cost of the seed; how much seed per acre would be required; would it be better to sow in the fall or spring; would it stand without water from now until winter after having been well irrigated?—L. P., Waterford.

We doubt not this will do well in the Turlock district. The tests made would indicate that conditions prevailing there would meet its requirements perfectly. The seed cannot be secured at this time. Importers are planning to supply seed houses for the coming fall. It is estimated that the cost will be about double that of the ordinary alfalfa seed. So far as we have heard about the same number of pounds of seed per acre will be required as for the common variety, or about 20 pounds. If you have reasonably clean seed, that amount will give you 44 plants to the square foot which is more than thick enough if all seeds grow. Of course the amount of seed required depends upon the nature of the land and the care with which it is sown. We would prefer fall sowing if water can be had to put the land in good moist condition; otherwise February or March, or just as early as we could feel sure that frost would not catch the young plants. Once established it is possible that no irrigation during last part of the summer would not kill it out, but of course unless the land were naturally moist no crop need be expected.

### Cabbage Worms.

Please tell me what will kill small green worms on cabbage? I have used oil of bergamot diluted with water; also gasoline and a lime solution, but have been unable to exterminate them.—T. P., Elkgrove.

If the plants are young and not near the stage when they will be used on the table, we would spray with Paris green or arsenate of lead. If in garden or in small quantity, hand picking of the worms is often resorted to and is the safest method. Another remedy is buhach or insect powder stirred in water and sprayed over plants.

### Lady Bugs.

A subscriber writes to the Cultivator asking as to whether there is any market value for colonies of lady bugs, and if there might be a business developed in gathering and shipping them to fruit growers who might wish them for insect pest destroyers If any of our subscribers know of wants along that line, and will write us, we will put them in touch with our inquirer.

### Estimating Hay in Stack or Mow.

Kindly tell how to measure barley hay in the stack.—A. L. C., Gardena.

No absolute method can be given because of variation in kinds of hay and length of time since stacking. Of course old hay which has settled for several months is more compact than new hay which has just been thrown up. Alfalfa is much heavier than barley. The weight also varies according to whether it is fine and short or has strawy stalks. Approximately we may say that a ton of hay occupies about 400 cubic feet. Therefore to secure the tonnage of stack, multiply together the length, breadth and heighth to the eaves or angle as which stack begins to slope. This will give the cubic contents of the lower part of stack. Then to find the contents of upper part, multiply length by breadth by one-half vertical distance from level of eaves to crest (if angle is reasonably regular). Add contents of upper and lower parts, of course keeping all dimensions in feet, and divide the sum by number of cubic feet allowed to a ton, or as we have said approximately 400 feet, or possibly for barley 450.

### Wonder Berry.

A subscriber at Trail, Oregon, writes: "I enclose clipping from an English paper referring to the wonder berry. This has been largely advertised and I bought some of the seed. Have some plants growing and blossoming. This clipping taken from an English paper says:

"The Wonderberry (Solanum nigrum)—A printed description has been widely distributed in this country of a plant of very doubtful character. Botanists who have examined both flowering plants and seeds of it are certain of its identity with one of the commonest of all annual weeds, the fruits of which are not only disagreeable, but poisonous. We have received from several correspondents plants which they had raised from seeds of the wonderberry, and in every case they have proved to be Solanum nigrum. This plant is undoubtedly poisonous, children who have eaten the fruits having died soon after from the effects, which are very distressing—vomiting, colic, convulsion, etc.

We believe many people in this country have been induced to purchase seeds of the wonderberry, and, notwithstanding what has been said of it by the vendor, we warn them that the plant is dangerous."

The subscribers adds: "If this newspaper clipping be correct, the lives of many are in danger, and wide publicity should be given to the facts."

We have referred our subscriber to Mr. Roeding's article in our issue of August 5th, in which he spoke of eating a couple of handfuls of the wonder berries and finding them good.

This berry has called forth the sharpest criticism from all parts of the country. No doubt it has been boosted beyond reason, but we presume has some merit. The danger of poisoning is certainly exaggerated by our English contemporary.

### Zapote.

Mr. M. E. Dillingham of San Gabriel, recently brought to the Cultivator office a sample of fruit shaped somewhat like an apple and having oblong seeds. The tree on which the fruit grew is located on the corner of Washington and Figueroa streets in Los Angeles, and no one had been found who seemed to know anything of the fruit or the history of its planting. The leaves and seed were referred to Dr. F. Franceschi of the Southern California Plant Introduction Gardens at Santa Barbara. He writes us as follows:

"Casimiroa Edulis, (zapote blanco) of the Mexicans, is the name of the tree of which you enclose leaf and seed. It is a native of almost all the northern states of Mexico. In 1893 when I lived in Los Angeles, I had noticed this particular tree, at the corner of Figueroa and Washington; there were two of them at that time, about 10 or 12 years old, and they had been frozen down to the ground more than once in their young years. If I remember well, they were the only ones of their kind in L. A. in 1893. There must be quite a number at present."

In addition he enclosed circular regarding fruit, from which we quote: Casimiroa Edulis; the first semi tropic fruit ever produced in California, there being one large tree in Santa Barbara, coeval with the Old Mission, and more than 100 years old. This grows to quite a large size, very much spindling up in the young stage, but, with time making a spreading, dome-shaped, umbrageous tree. Leaves trifoliate, shining, generally dropping about August, but coming out again at once. Fruits size and shape of an apple, yellowish,

**ONE MILLION BABIES**

Is what we will sell between now and next July. How MANY DO YOU WANT? What KIND? AND WHEN? We can have them ready for you. Write us now so we can plan together to please you. Our prices are low right now, contract for the chicks at the old prices between now and September 6th. After that date prices on some kinds will positively be raised. We will have off a BIG HATCH SEPTEMBER 6TH, all kinds most, and at the old prices. Send for baby chick catalog today, it tells all about it.

containing a very sweet pulp, which in Mexico is said to make one go to sleep if partaken of too freely."

### Plowing.

For grain crop, how deep and how often should the land be plowed?

When is the best time to plow for barley? for alfalfa?

I am taking out an old orchard this month. Would you advise a grain crop on that land first or will alfalfa do well? Will alfalfa make seed the first year?

On an 80-acre alfalfa ranch, what is best for lining ditches and reservoir to prevent seepage?—J. A.

The depth of plowing for grain will depend something on the depth of former plowing as it is not advisable to turn up too much soil that has not been exposed to the weather at one time. It is safe, and in most cases best to plow about an inch deeper than the old plowing each year until a depth of 8 to 9 inches has been reached. This gives a seed bed that is deep enough to hold sufficient moisture to mature a crop in all ordinary seasons. One deep plowing each year is sufficient but if fall plowing is done the soil should be made firm, which can be done by going over it with a disk harrow set straight, so that it will not stir the ground, then go over the surface with a spike tooth harrow to pulverize the surface and prevent evaporation. If the sowing is done immediately after the firming of the ground is done the harrowing can be done after the sowing, but if the plowing is done early in the season the harrowing should be done as soon as the disking is done and all should closely follow the plow.

The seeding should be done with a drill as all the seed is then covered at an even depth and the increase of yield will much more than pay any added expense. The young grain should also be gone over with a spike tooth harrow after every rain, as soon as possible to get on the ground with a team, until the grain begins to make joints.

This helps greatly to save the moisture that would otherwise go off without benefiting the grain, and will in no wise damage the grain.

There is no one date that is better than another for plowing except that it is best to have it done so as to be able to have the grain in early enough to get the benefit of all the rain.

If alfalfa can be sowed early enough in the fall to have the first leaves before frost comes it will make several more tons of hay per acre the first season than if sowed in March,, or after the danger of frost is past.

There is no reason you should not sow alfalfa on the old orchard ground this fall if all the loose roots that might be in the way of the mower have been removed and the ground flooded to settle the loose dirt where the trees were removed.

Alfalfa will make seed within a few months after sowing, but the crop will be light.

Cement lining is best for all permanent ditches and reservoirs but a fairly good lining can be made by using heavy crude petroleum well worked into the banks and tamped down.—J. B. N.

### Pruning Berry Vines.

Will you please give me instructions in regard to pruning mammoth black berries. I set some out last April and they now have vines fifteen to twenty feet long. Also should dew berries and Logan berries be pruned?—J. T., Santa Barbara.

A very good method is to cut the mammoth vines back to say ten feet and if you would stretch a wire along the row about 15 or 18 inches above the ground and tie the canes to it, the fruit next season would be kept off the ground. If quite a number of canes have grown out from each plant thin out the weakest and leave not more than five or six. This pruning can be done any time from November to February.

Many growers prune and trellis both Logan and Dewberries. I always thought it wasted labor to trellis either unless one had but a very few vines in the home garden. If you wish to trellis them do it as above described—and prune so that the canes will meet along the wire when laid each way from the plant. If you leave six canes to the plant this would allow three each way. If your plants are very close in the row it will not hurt to allow the vines to more than meet, but keep in mind that the more canes that are allowed to remain, the smaller the fruit.

If you do not trellis, prune the same as described and lay the vines the same—keeping them in place with small pegs or stakes. In the spring when they throw out their fruit stalks they will all crowd up toward the light and it will be easy to gather the fruit. The wood that has fruited should be cut out just as soon as the crop of fruit is off and the bed kept free of weeds. This pruning can be done any time during the winter.—Q. A. L.

### Lice.

Have a young Jersey cow fresh last March with first calf. About two weeks ago the hairs on her right hip came off in spots the size of a quarter. She got thin and fell away in her milk to almost nothing for three or four days, when she got back to normal. She is fed nothing but green alfalfa.—H. G.

I would suspect chicken or other lice and would wash the cow with one of the coal oil derivaties as cresol or creolin. There are a number of others that I do not recall at present, but the local druggist will give them to you. There is a form of scaly ring worm that sometimes affects cows. This should be washed with warm soap water containing carbolic acid until all the roughness disappears and then lard and sulphur well rubbed in. Red murcurial ointment is almost a certain cure, but the cow must not be allowed to lick it. The lard and sulphur is harmless. When lice are on cattle examine for them about the ears and under the crotch of the forelegs.—M. E. S.

### Garget.

We have a six year old Jersey cow that has had her third calf and ever since her last calf we have had trouble with one of her teats. It is hard to milk and only gives about one fifth as much as the other teats and the milk is lumpy. Should we dry it up or not? Do you think it will be all right when she is fresh again?—A. C. P.

A touch of garget. Bathe the udder in warm water and manipulate the quarter affected, milking slowly until all the milk is drawn. If in these cases an hour a day was spent on the quarter for one weeks' time the trouble would be cured. Hot water or hot lard well rubbed in five minutes, at least, by the watch.—M. E. S.

### Milk Fever.

Please give remedy for milk fever My cow was affected at freshening time with last two calves.—A., Modesto.

It is only by good fortune that this cow has escaped death in two attacks of milk fever. Chances are she will go this next time. It would be kinder to milk a cow like this for a couple

(Continued on Page 191.)

### THE BOY FROM TOWN.

Lst night a boy came here from town
To stay a week er so
Because his maw is all run down
And needs a rest, you know.
His name is Cecil, and he's eight,
And he can't skin the cat—
His maw she calls him "Pet"; I'd hate
To have a name like that.

He wears a collar and a tie
And can't hang by his toes;
I guess that I would nearly die
If I had on his clo's;
He can't ride bareback, and today
When we slid on the straw,
He ast if roosters help to lay
The eggs I pick fer maw.

When our old gander hissed he run
As though he thought he'd bite,
And he ain't ever shot a gun
Or had a homemade kite;
He never milked a cow and he
Can't even dive or swim—
I'd hate to think that he was me,
I'm glad that I ain't him.

He thinks it's lots of fun to pump
And see the water spurt,
But won't climb in the barn and jump
For fear of gettin' hurt.
His clo's are offle nice and fine,
His hair's all over curls,
His hands ain't half as big as mine,
He ought to play with girls.

A little while ago when we
Were foolin' in the shed
He suddenly got mad at me,
Because I bumped his head.
There's lot of things that he can't do,
He thinks that sheep'll bite,
And he's afraid of ganders, too;
But he can fight all right.

—S. E. Kiser.

### SHE WAS PARTICULAR.

"IT'S not a bit of use trying to please neighbors," remarked Mrs. Deeson. "I've done my best to be neighborly with Mrs. Harker, I'm sure. I put on my best clothes and called almost before the movers had gone away. Then that very afternoon, just to show her that I didn't want to put on airs, I borrowed some flour from her."

"I always found Mrs. Harker very friendly when she lived near me," said Mrs. Deeson's caller.

"Oh, she's friendly enough. It's just that she's a little too snippy to suit me. I used to use her telephone a lot—it was unlimited and I couldn't always be going to the drug store with my nickel, and hers was so handy that I used to go over often. She never had much to say, but I asked her one day how she liked doing her own work. She said she wouldn't mind it if she had some one to tend the door. I didn't think the remark tactful, as I had been there three times that day."

"Maybe she didn't mean anything. I always found her very willing to do for others."

"That's the way I am—always helping some one. One day I ran in to see if she had her coal range going and when I saw it was I asked her to let me put a pot roast on and save my gas. Of course I offered to help her any time.

"'Thank you,' she said. 'Perhaps you won't mind letting baby go to market with you; he's fretting to be out of doors and I want to bake some pies.'

"'Oh, very well,' I said, though I don't like pushing baby cabs, 'I'll take him along.' I did and she acted very hateful afterward."

"That isn't like Mrs. Harker," commented the caller.

"Maybe she thought she had reason to be mad. I left her baby in front of the grocery while I went into the market and as I went out at the other door I forgot the child. Anyway, it didn't hurt him to sit there in the sunshine, and I couldn't be expected to remember everything with so much on my mind."

"When did you remember him?"

"I didn't until she asked. I offered to go after him as soon as I had put my dinner on to cook, though I really hadn't time to go back. Still, I wanted to do the right thing. Was she satisfied? Not she! She had her hat on in a jiffy—didn't even stop to wipe the flour off her hands—and flew down the stairs as if some one was going to eat the child."

"What a fuss about a little thing! The baby hadn't cried much. A little crying is good for children. Well, she was real frosty with me for a time. But I don't bear any malice, so one day when she was baking I asked her to exchange pies with me, since it is not much more trouble to bake two pies than one. Her pies are awfully good—so are mine, for that matter, though I hate the trouble of making 'em.

"She had some unexpected company the next week and so she asked me for a pie. I gave her one I got from the bakery."

"I don't wonder she—"

"Oh, it was a good enough pie, and I didn't feel like baking that day.

"I borrowed some eggs of her a long time ago when they first moved in. Of course I intended to return them at once, but somehow it slipped my mind. As soon as I did think of those eggs I rushed right over with 'em—made a special trip. Was she grateful? No, I should say not. She said I borrowed the eggs when they were 50 cents a dozen and returned them when they were 15 cents, and that I ought to pay the difference.

"'I didn't borrow money.' I told her. 'I borrowed eggs—and here they are.'

"'You ought to make up the extra cost of the eggs you got of me,' she said.

"'I never knew that a dozen eggs was more than a dozen eggs,' I answered, putting them on the table, 'and they are the last thing I'll ever borrow of you.'

"'Thank goodness! They are cheap at that price!' said the spiteful thing.

"'I haven't been inside her door since then! Neighborly, indeed!'"—Chicago Daily News.

### FIRELESS COOKER RECIPES.

There are certain things to be remembered by the inexperienced cook. One is that if a dish is left indefinitely in the cooker it will sour. Soups, stews, vegetables and such things must be removed when they have been in twenty-four hours and less in hot weather.

Another thing is that some foods require a longer time on the fire before being put in the cooker than others do. Cereals may take only ten minutes, and tough meat half an hour; it is best to find out something about the length of time the different things require before beginning to use the cooker. Generally speaking, all indigestible things take longer than the rest; oatmeal, beef stew, corned beef and beans need more time than steamed puddings, rice and chicken.

A third thing to remember is this: Everything that takes a very long

time to cook is improved, and the process hastened, if, when the time is half up, and the food cooled, the pail is removed and reheated without opening it, and put back again. In all cooking, also, one must be careful not to uncover the pail with the food in it before putting it in the box. It must be kept tightly covered from the time it is put on the fire, or the steam will escape, and the meat or soup cool so that it cannot cook. Put everything in as quickly as possible, and cover at once.

**Cereals.**

Fill the large outer pail with water and bring to a boil. Put in the smaller one the required water, and boil this also; add the meal and salt, cover and boil hard ten minutes; put the smaller kettle inside the larger and set away in the box; leave over night, and in the morning beat up well and reheat. Oatmeal requires one cup of meal to three of water, and cornmeal and rice four of water.

**Vegetables.**

Prepare these as usual, boil for five minutes, put the inner kettle into the outer filled with boiling water without uncovering and set all away. Potatoes will cook in an hour if small; they must be dried in the oven later, to make them mealy. Pease, if tender, will cook in an hour; beets, squash, turnips and carrots take three hours, and should be taken out when half done and reheated, the water in the outer kettle reboiled and both returned to the cabinet.

**Baked Beans.**

Soak the beans overnight in cold water; in the morning turn this off and add twice as much fresh water as beans; and also a piece of salt pork. Boil hard for fifteen minutes; put this pail in the boiling water in the outer pail and set both in the box for three hours. Remove, boil hard again, and put back three hours more; put into a baking dish and brown in the oven. Add salt, molasses and a little dry mustard at the time of the second heating.

**Boiled Fish.**

Put the fish in a clean piece of cheesecloth and tie it up; simmer ten minutes in boiling water; set the pail in the outer one of boiling water and put away three hours.

**Soups.**

Cut up the meat, and put it on the fire in cold water; boil the vegetables with the meat; season well; leave in the cooker all night; skim, strain and reheat.

**Roast Meats.**

Sear the roast all over in a hot, dry frying-pan; put in a very hot oven in a pan with two cups of water, and bake twenty minutes; bring the water in the outer pail to a boil, put the roast in the inner pail with seasoning, cover tightly, and set in the one with the water; cover this also, put on the fire, and boil hard ten minutes; put in the cabinet for three or four hours, depending on the size of the roast. Remove, and thicken the gravy on the stove and reheat the meat. Chicken is especially good prepared in this way.

**Boiled Meats.**

Corn Beef.—Put the meat over in cold water in the morning and let it come to a boil; simmer fifteen minutes. Set in the outer kettle of boiling water, and put away for five hours in the box; prepare the vegetables, open the kettle, and put these under the meat; reheat all and return to the box for three hours; this will be done by night.

**Beef Stew.**

Cut up the meat and brown quickly in hot fat; add a cup of water to two of meat, with seasoning; boil ten minutes, and put into the box for two hours. Reheat, and cook two hours more in the cooker.

**Lamb Stew.**

Cut up the meat, put on the fire, and cook ten minutes; put in the cooker for two hours; take out, add minced vegetables or tomato, reheat, and cook two or three hours more.—San Jose Mercury.

**THE SAVINGS AND LOAN SOCIETY**

**101 MONTGOMERY ST.**

**SAN FRANCISCO**

For FIFTY-TWO YEARS this bank has conducted a savings bank business exclusively. It has always paid the highest rates of interest consistent with sound banking. Our interest circulars show the rates paid during the entire life of the Institution. Accounts may be opened by mail.

**THE OLDEST SAVINGS BANK IN CALIFORNIA**

**ATLAS E-Z SEAL JAR**

When preserving time comes round and the "jar question" comes *up*, you will decide wisely if you choose jars of the "Atlas" brand — they are far superior to all others. The Atlas E-Z Seal Jar shown below is an *instant* and *perfect* sealer. It has a *wide mouth*, that permits the preserving of whole fruits. It is extra strong at the top and *not* easily broken. It is made by machinery and therefore of uniform thickness and perfectly smooth finish. The most convenient jars to *fill*, *empty* and *clean* are "Atlas" brand jars.

**ATLAS SPECIAL MASON**

is another extra good jar. It possesses every advantage of the E-Z Seal — strength, wide mouth convenience and smooth finish, but closes with a screw cap. Made specially for those who prefer this kind.

**A Book of Preserving Recipes**

Sent free to every woman who sends us the name of her grocer, stating whether or not he sells Atlas jars.

If your dealer cannot supply these jars, send $3, and we will express prepaid thirty (30) quart size ATLAS E-Z SEAL JARS to any town having an office of the Adams or U. S. Express Co., within the States of Pennsylvania, New Jersey, New York, Delaware, Maryland, Virginia, West Virginia, Ohio, Illinois, Indiana or Michigan, or we will quote delivery prices in other portions of the United States by freight or express.

**HAZEL-ATLAS GLASS CO., Wheeling, W. Va.**

**WOULD YOU LIKE TO SLEEP ON A MATTRESS**

That is guaranteed to be absolutely hygienic?

That insures healthy, comfortable sleep?

### Hay.

Arrivals of hay for the six days past have been 5150 tons. The continuation of these very heavy arrivals is beginning to be thoroughly felt on the market here. Prices during he week have not been maintained, as a lowering in figures all along the line has been necessary to effect the sale and removal of hay from the cars and boats.

The single exception to this general lowering of values has been in strictly fancy varieties. Arrivals of such choice hay have been very light, and what has come in has been readily placed at top figures.

Alfalfa hay continues to arrive in moderately large quantities, and appears to move off fairly well, although not actively. Prices on alfalfa hay continue about as they have been of late.

Arrivals of straw have not been large, alhough the demand throughout the week has been moderate, so what has been offered has met with fairly good sale.

This week's quotations are:
Choice wheat hay .....17.50@18.50
No 1 wheat or wheat & oat 16.00@17.00

## Citrus Market

LOS ANGELES, August 18, 1909.

The orange market is materially better than for some time. The general range of quotations on desirable sizes and stock is at least fifteen cents bettre than a week ago. It is possible the sultry weather of the present over the Middle West may discourage prices, but the outlook is good for the continuation of the upward trend. Seedlings and others than Valencias are practicaly out of the market, which leaves the few yet to go a fairly free field. Off sizes and lower grade fruit are not desired as a rule and closer culling is being engaged in.

Lemons are strictly in good form. The excessively warm weather which may prove discouraging to the orange market, has given a great boost to lemons and all stock has been closely picked up. Some sales of first class goods have been made at $4.00 f.o.b. California points. $5.00 and $6.00 f.o.b. Eastern points has also been reported.

**Shipments.**

Total shipments of citrus fruits to date this season, 35,230 cars, of which there were 29,638 oranges, 5,592 lemons.

NEW YORK, Aug. 13.—Five cars oranges sold. Market is unchanged. Weather cool; raining.

## EXPERIMENTAL FARMING IN NEVADA.

Through the construction of large storage reservoirs and irrigation works, the United States Reclamation Service is preparing for agricultural usefulness large areas of land in the arid regions of the West. As these lands are largely taken up by settlers from the older States farther east who know little or nothing about the difficulties they will have to meet, the Reclamation Service some time ago called on the United States Department of Agriculture to establish experiment farms to assist in working out the problems involved in these new conditions. A number of such farms have been established, and it appears that the results of this experimental work will be of great value.

One of these irrigation schemes, known as the Truckee-Carson Project, is located in western Nevada, and covers 350,000 acres of irrigable land lying along or near the main line of the Southern Pacific Railway which runs from Ogden to San Francisco. The mining towns and camps of this region furnish an excellent market for all kinds of farm products, especially vegetables and hay. Alfalfa, cereals, and many vegetables and fruits can be successfully grown. But the peculiarities of the desert soils, and especially their lack of organic matter, make farming on these soils a difficult task for the inexperienced settler.

The Truckee-Carson Experiment Farm was established on a tract of desert land near Fallon, Nev., in the fall of 1906, the United States Department of Agriculture and the Nevada State Experiment Station being cooperators in its management. Experiments in crop growing were begun in 1907, and the operations have been greatly enlarged since. Considerable progress has been made in discovering the crops and methods best adapted to the conditions, and the results secured have just been given to the public in a bulletin of the United States Department of Agriculture. In fact, however, the experimental work on this project has only fairly begun, and it will take several years to fully determine the field and garden crops and the fruits which can be most profitably cultivated and the best methods of soil management.

The Imperial Standard calls for a halt in the booming of cotton as an immensely profitable crop in Imperial Valley. It maintains that while the growing of cotton has been successfully demonstrated, its gathering in a large way at a figure that will permit profit to the grower is yet to be shown.

## QUERIES.

(Continued from Page 187.)

of years and then let her be beefed than to subject her to so much suffering each time she freshens. The preventive treatment consists in reducing the cow's condition before she calves. Cut off all grain for the last two months, the last week give her hay only and only as much as she will promptly eat up clean, at a feed twice a day. Then give her a dose of salts so as to have the bowels freely opened before she calves. One and a half pounds of Epsom salts with a couple of tablespoonfuls of powdered ginger and a tablespoonful of saltpetre. Give with it water enough to make a half gallon. If this comes in within twenty-four hours of calving time, all right. After she calves put on a light blanket and keep her out of drafts. Feed her lightly on bran and alfalfa hay. Now comes the most important part of all, avoid milking her out clean for forty-eight hours. Milk only a quart or so often, at least every eight hours, imitate the calf by not emptying the udder all at once. In the Channel Island the Jersey cattle at home never have milk fever while the same cows did have it in the United States, before this simple little rule was found out. The object in giving the physic is to help along as this cow has had the trouble, and cannot be considered as a normal subject.—M. E. S.

### Eucalyptus for Moist Land.

I have a piece of land on which the water stands up to April or May. Is there a variety of gum trees which will grow in such land and can stand frost? It freezes quite hard on this particular land.—J. K. G.

Your conditions might possibly be favorable to the botryoides or swamp mahogany, sometimes called in Australia bastard mahogany. It possibly will not stand the degree of cold you have. This variety has done well at the experiment station at Santa Monica. Mr. Ingraham, in Bulletin 196 of the State University, says "This species is considered by Australian writers one of the best of the eucalypti when grown where there is plenty of water. One tree at the station has reached a height of 38 feet in six years.

### Trespassing Chickens.

Has a neighbor a right to let his chickens run loose so that they damage another's grapes and other fruits? Is the damaged party allowed to kill the chickens if they are permitted to continue their depredations after owner has been requested to keep them at home?—M., El Cajon.

This query has been answered by Mr. Payne to the effect that stray stock of all kinds may be taken up and kept until claimed by owner when a reasonable charge may be made for its keep. Legally there is no right accorded to kill another's stock. See answer to "Poisoning Chickens" in issue of May 27th. Of course if any damage results from the trespass you have cause for action and can collect.

### Peach Pits.

What is the best variety of peaches to select pits from for nursery purposes?—J. M. R., Moorpark.

The best variety of peach for propagating purposes is any kind of thrifty growing seedling. Some nurserymen go so far as to send to North Carolina to the old seedling peach orchards there for pits as it is practically impossible to secure them in California. On the other hand, many nurserymen simply go to the canneries and scoop up the pits. These will give a reasonable percentage of strong growing trees, but they will not be so uniformly thrifty as seedling pits.

**Wire Stretcher and Hoist**

**$1.90** Express Prepaid

Money refunded if not satisfactory. Just the thing for stretching wire and butchering hogs and calves. It lifts and pulls anything. Automatically grips the rope at any point. Order today and send for catalogue of wire fences.

**Pacific Fence Construction Co.**

**352 Market Street San Francisco**

### Weevils in Beans.

What will keep weevils out of beans and other seed that is stored away?—V. A. Broadbent, Anaheim.

See answer to query, "Weevils in Beans" in our issue of August 5.

### Morning Glory.

I have a patch of wild morning glory on my place. I plowed it last summer expecting to kill it, but it only seemed to stimulate the growth. It is now thicker and spread over more ground.—F. T., Los Olivos.

See article on first page of this week's issue. Do not think that one or two or even a dozen plowings will eradicate this pest. It is a question for eternal viligance.

## ALFALFA AS A SOILING CROP.

The readiness with which alfalfa renews its growth after each cutting, as well as its value as a feed, makes it an ideal soiling plant for all classes of stock. There is practically no danger from bloat, as is the case when the alfalfa is pastured. The field from which the daily cuttings of green feed are taken should be large enough to be cut over in four or five weeks, as under such conditions the part of the field first cut will be ready for the second cutting by the time the first crop is entirely utilized.

Afalfa is very long-lived; fields in Mexico, it is claimed, have been continuously productive without replanting for over two hundred years, and others in France are known to have flourished for more than a century. Its usual life in the United States is probably from ten to twenty-five years, although there is a field in New York that has been mown successively for over sixty years. It is not unlikely that under its normal conditions and with normal care it would well-nigh be, as it is called, everlasting.—Coburn's "The Book of Alfalfa."

Many sections of the San Joaquin Valley find potatoes begging at six bits a sack.

The farmers union at Turlock has shipped 120 cars of watermelons.

From the Baker Mfg. Co., who manufacture the Twentieth Century Grader, we have received copy of their new irrigation folder headed, "Dollars in The Ditch." They will be glad to send the folder to anyone who will drop them a postal card with request for same. Their address is Fisher Bldg., Chicago, Ill.

60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it fails to do this, **any** money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

Write for Catalogue.

# Copa de Oro -- the Cup of Gol

## The State Flower of California

COPA DE ORO,—cup of gold—no fitter name than this one given by the poetical Spanish-Californians, could have been found for the golden poppy, whose lustrous petals truly rival in hue the precious metal dug so freely from our California soil. A royal flower, dauntlessly gazing into the eye of the sun as it courts his warmest caresses, and abounding with vitality and life, the California poppy was well chosen as the emblem of a State noted for the aggressive activity of her sons and beauty of her daughters.

It is a most beautiful sight in spring and early summer to see whole hillsides aflame with this lovely flower, looking as though a carpet of gold had been spread on the earth. But it is not only in the spring that the Eschscholtzia blossoms—there is scarcely a month in the year when gold cups may not be found springing up from its spreading bunch of pale-green, finely dissected leaves.

Many artists have essayed to paint this wondrous blossom but few have done it justice, and the photographer's difficulties are even greater than those of the man of pigment and brush, for though he may faithfully reproduce its beautiful form, he cannot hope to render its gorgeous coloring.

Though the large red-gold cup is the most widely distributed throughout the State and may be considered as **the** California poppy, there are several other varieties of the Eschscholtzia, varying from the deepest orange to a yellow so pale as to be only a shade moved from white.

The large orange poppy flourishes well on the foothills and inland slopes, but rarely to be found near the sea. Just above the University at Berkeley, the writer has gathered some extremely handsome blossoms. Unlike its smaller sisters, the whole flower is of one tone—petals, pistil, and the velvet covered stamens—rich, deep, red-gold.

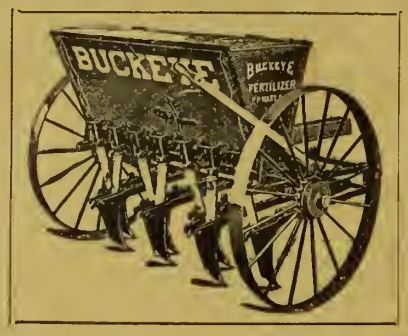
The Eschscholtzia is useful as well as beautiful. In the olden day its leaves were used by the Indians as a vegetable. A mild drug is extracted from it which is valued as a remedy in certain disorders. The Spanish-Californians make a preparation from the **copa de oro** in conjunction with oil, which they esteem highly as a dressing for hair, whose growth it is said to promote, making it glossy and luxuriant. Certain it is that the senoras and senoritas usually have magnificent tresses. The rarest of all the varieties is the one popularly known as the white poppy. In reality, however, it is not white, but a very pale lemon color.—Outwest Magazine.

For use in orange groves and vineyards there is nothing better than the

# Buckeye Fertilizer Drill

Set of plates furnished **FREE** with each new drill, if desired,

**For Sowing Vetch and Peas**



We have sold a great many carloads of these drills in Southern California and the Buckeye is now recognized by orange growers and fertilizer men as the best drill made for handling commercial fertilizer. Its low wheels, proper sized box, and large feed openings giving great capacity when desired, make it especialy adapted to orchard use.

Have an entire pumping plant that is strictly guaranteed, and one that will give satisfaction and is good for nearly a life time with practically no costs for repairs.

More water, more economical, less fuel, less expense, more power. You do not have to spend your life's income for repairs, as this machinery is made from the very best material and workmanship that money can procure. Every piece of machinery thoroughly tried and tested before it leaves the factory.

I am the agent for Southern California, for this machinery, and for the next 60 or 90 days I am giving 10 per cent off of the regular selling prices of the Hercules engine and Krogh pumps, in order to give the public a chance to buy a substantial well made entire pumping plant very reasonable in price.

No irregular nor complicated parts to get out of repair at the very busiest season when you need the most water.

Ask your neighbor about the Hercules engine and the Krogh pumps and if he has ever used them he will recommend them to you every time, as every one or persons that has used any of this machinery is always willing and ready to give them the very highest of recommendations.

I will contract to install any of this machinery after the 1st of November either as a plant or pump or engine separate of any sized pump or engine.

# Value of Wild Birds in Field and Forest

## An Address by Wm. L. Finley Before the National Irrigation Congress at Spokane August 11, 1909

WE ALL know that the real wealth of the country is based upon agriculture and horticulture. Without the help of our wild birds farming would be immpossible. No farm hands can accomplish the work intrusted to the birds. Wild birds of orchard, field, and forest are Nature's check upon the increase of insect life. With the great handicap of bird destruction in the present day, the loss from insect and rodent pests in the United States during the past year is estimated to be $800,000,000. This loss can be reduced only when a public sentiment is aroused for proper bird protection. The practical farmer cannot afford to ignore the relations which wild birds bear to his crops. They are a part of the natural resources of any farm. The farmer will prosper in proportion to the way he encourages these extra hands that Nature has given him.

While the value of the birds to the farmer, orchardist and planter has for year been recognized, it is believed by the authorities that their importance in preserving the forests is not generally known. According to a recent report of the government, insects alone cause an annual loss to the trees of the country estimated at over a hundred million dollars. On the oak alone 400 species of insects which are sought and consumed by the birds of the forest, prey constantly, the experts of the Biological survey have discovered. On the willow 186 such species constantly attempt its destruction, on the pine 165, on the hickory 170, on the birch 105 and on the elm 80. Careful analysis of the stomachs of thousands of wood-peckers, titmice, creepers, kinglets, wood warblers, wrens, fly-catchers, swallows, nut hatches and other birds of the woods show that their constant labor is to consume just these devasting insects.

Birds work more in conjunction to help him than any other form of outdoor life. They police the earth and air and without their services the farmer would be helpless. Larks, wrens and thrushes search the ground for grubs and insects. The food of the meadow lark consists of 75 per cent of injurious insects and twelve per cent of weed seed, showing that it is a bird of great economic value. Sparrows, finches and quail eat a large amount of weed seed. Practically all the food of the tree sparrow consists of seed. Examinations by Professor F. E. L. Beal of the Biological survey of the Department of Agriculture show that a single tree sparrow will eat a quarter of an ounce of weed seed daily. In a state the size of Iowa, tree sparrows alone will consume more than eight hundred tons of weed seed annually. This, with the work of other seed-eating birds, saves the farmer an immense amount of work. Nut hatches and chickadees scan every part of the trunks and limbs of trees for insect eggs.

The valuable service which birds render about the farm is shown most strikingly in places where insects and rodents have become so numerous as to destroy crops. Birds collect in such places where food is abundant and by giving their whole time to hunting and eating these insects, they become the most valuable assistants the farmer can have. To illustrate, a few years ago a large apple orchard in central Illinois was attacked by canker worms. Professor S. A. Forbes spent two seasons in this locality studying bird life. He examined the stomachs of 36 different species of birds and found that seventy-two per cent of these were eating canker worms. Taken as a whole, 36 per cent of the food of all the birds of the locality consisted of these worms. Out of a flock of 35 cedar waxwings, seven were killed and examined. With the exception of a few small beetles, these birds were living entirely on canker worms. By actual count, he found seventy to 101 worms in the stomachs of each one of these birds. If we assume that each waxwing ate a hundred worms a day, which is a very low estimate, the flock of 30 were destroying 3000 a day, or during the month when caterpillars were out, a flock of 30 waxwings would eat 90,000.

A number of years ago blackbirds were exceedingly abundant through eastern Nebraska. They were so plentiful that the farmers believed they were damaging crops. They began poisoning the birds. A single grain of corn soaked in strychnine was enough to kill a blackbird. In the years that followed, great numbers of these and other birds were destroyed during the spring and fall. At the same time thousands of quail, prairie chickens and other game birds were killed in every county to supply the market. As the birds began to disappear, swarms of locusts took their place. These insects hatched out in countless numbers and began devasting crops. Few fields of grain escaped damage. Many were entirely destroyed. Where blackbirds, quail, prairie chickens, plover and other birds remained, they took to living entirely on locusts. In such localities fair crops were secured solely through the assistance of the birds.

The members of the United States Entomological commission who witnessed the work accomplished by the birds in this region, said the results were so complete that it was impossible to entertain any doubt as to the value of birds as locust destroyers.

Years ago a hunter along the Massachusetts coast shot some terns and sent the plumage to a New York milliner. The tern is a bird that is sometimes called the sea-swallow or summer gull. Its plumage is as delicate as its flight is graceful. The long pointed wings and tails of these birds at once become stylish. 'Send more tern wings. We can pay cash for all you forward,' the telegram ran. Dealers in plumage immediately issued circulars asking for large quantities of terns and sea gulls. The demand kept running ahead of the supply. Up and down the Atlantic and Pacific Coast and through the country the word went forth.

Never had there been such a slaughter of birds in this country. Thousands of terns were killed along the coast of Massachusetts and at other breeding places. At Cobb's Island, Virginia, one of the baymen said 1400 terns were killed in a single day and 40,000 were shot during the summer. The destruction at other places was equally great. In two or three seasons the killing of these breeding birds had its effect. These well known bird colonies were a thing of the past.

One can get an idea of the slaughter of one species of tern by glancing at the records of the feather sale at the Commercial Sales Rooms in London on April 14, 1908, when one shipment of over 14,000 sooty terns was catalogued. Again at the sale on June 10, 15,500 more skins of this same species were on sale. This means that professional plume hunters had found and raided new breeding places of this species and practically every bird had been killed. This is but one example.

Years ago great flocks of gulls and terns added life and interest to our sandy shores. White herons flocked through swamps and everglades of the southern states; the great tule marshes of the West were white with the nesting multitude. In those halycon days men would have scoffed if you had said these birds, so strong in numbers, could have been destroyed. They were so harmless to mankind that at that time no one could think of a cause that might lead to their extermination. There was no cause except their marvelous beauty. Yet in less than a quarter of a century some of the plume birds nave all but taken their places with vanished races.

Although the decrease of bird numbers has been so marked in our country, it has been more deplorable in other lands. The demands for plumage of wild birds have been growing. All through the tropical countries natives were eagerly looking for an easy means of livelihood. Killing all kinds of birds has opened the way. Thousands of Indians and negroes have been supplied with guns and ammunition by traders. Everywhere they are roaming through the forests and swamps, seeking the last individuals of the species that are left. Many a rare and beautiful bird has been slaughtered beyond recovery. As the plumage of these birds has become scarce prices have soared higher and higher. But the money has been ready. So the natives have sought farther and harder to lay low the last plume bearer.

What will come of it all, this slaughter of the birds? If those plumes were only answering some real need,—but they are for decoration only. As yet no person has ever offered a single logical reason for this destruction, yet there are many reasons against it. The property of all nations must depend to a large extent upon agricultural pursuits. The dangers to agriculture from insects pests are well known. Wild birds are nature's check against the swarms of insect life. With our bird numbers so rapidly decreasing the balance of nature is bound to be affected. Our wild birds are as much a part of the natural resources of the country as are the forests and streams. For our own prosperity we should not permit these resources to be ravaged. Saving our wild birds is a debt we owe, not only to ourselves, but what is of more importance, we are in duty bound to transmit this inheritance to our children.

---

During the eleven months ended May 31, 1909, the United States imported 8,240,720 bushels of potatoes and exported 715,648 bushels; last year during the same period imports were 333,005 bushels, exports 1,164,136 bushels.

---

Imports of oats into the United States during the eleven months ended May 31, 1909, were 6,425,186 bushels, exports in the same period 1,487,967 bushels; during the corresponding period last year imports were 361,256 bushels, exports, 1,123,456 bushels.

# With the Citrus Growers

### A DESIRABLE NEW FRUIT.

THE greatest of all newly introduced plants we are sure is the Feijoa Sellowiana, a beautiful evergreen shrub, producing a profusion of charming flowers which later give way to the most delicious and aromatic fruit known. Unlike the Avocado, every one will relish the flavor of the Feijoa which can not be compared with any fruit known. In analyzing the taste, one detects the flavor of the pineapple, raspberry and banana. There is just enough acid in it to give it snap and insure its cooking qualities. For an all around useful fruit it can only be compared to the apple, being most delicious when in the fresh state, stewed, preserved or made into pies. The fruit is so highly aromatic that a small dish of ripe specimens would fill a room with perfume.

The writer predicts that at no distant date the Feijoa will be used to flavor fine confections and delicacies. The plant is a medium sized shrub, with light green foliage, the under side of which is silvery gray. It has proven to be more hardy than the guava and quite as heavy a producer.

From a statement by the Department of Agriculture it was first discovered growing in Uruguay in 1894. The first plants were produced on the Pacific coast by Dr. Franceschi of Santa Barbara about eight years ago. One of these found its way to Altadena, a suburb of Pasadena, and this bush has been producing quite heavy crops for the past four years to the writer's personal knowledge.

The plant flowers in May and June and like the fruit, the blossom cannot be compared to any other flower. There are usually from five to six petals of a heavy waxy substance, pure white on the under side and shaded from crimson to purple on the upper side. The feature of the flower is the great tuft of bright crimson stamens surmounted by yellow anthers. It has been discovered that the waxy petals are delicious to the taste and a fruit salad made of them would be a dish for the gods.

The plant responds to good culture and begins bearing in from two to three years after planting. The fruit does not ripen on the plant, but will fall when fully mature and ripens in from five to ten days.

For shipment East it will be one of the most successful as it will easily keep for three weeks after maturity. Ordinarily the fruit matures from the middle of November to the middle of December. Coming in as it does, when other fresh fruit is getting scarce it is bound to be popular.

The writer has been a great enthusiast on the possibilities of this fruit from the time he first saw it four years ago, but to satisfy himself he conducted a test last fall that has proven beyond peradventure the hold it will take on the populace. Out of forty persons, men, women and children tasting it, thirty-nine were most enthusiastic in its praises. The fortieth man admitted that it was good, but felt sure there were other fruits as good or better.

Summing up, the Feijoa is a most beautiful ornamental shrub when not in flower, a charming flowering shrub that would grace any collection of plants, and last but not least a plant that will supply a great quantity of superior fruit to be eaten fresh or preserved for later use. While the fruit somewhat resembles the guava in shape, it is very unlike it in the fact that the seeds are so small as not to be noticed at all.—Pacific Garden.

---

### AIR FOR THE ROOTS.

Under the title of "Air in the Soil and Air for the Roots," there appeared in the California Cultivator of July 29th a reprint of a bulletin of the Florida Agricultural Experiment Station, which in a few innocent looking sentences has hidden revelations of such magnitude as to set our views of the terrestrial economy of life upon an entirely new order. If the propositions of its author come only half true, then all our conceptions of natural philosophy elaborated through centuries of toil and honest effort would be shattered to the winds and life itself on this globe would have to come to a speedy end, through no fault of ours. Things look serious indeed, so let us see. Here are the sentences:

"We may forget that roots breathe the same as the other parts of the plants. They obtain oxygen from the air and throw off carbon dioxide gas. The spaces that occur between the soil particles are filled with water. Nearly all our farm crops except rice would perish in a waterlogged soil, but as the water is removed, air comes in to occupy the spaces that were filled with water and the soil improves. And the advantage which the soil obtains from rain and irrigation is by putting the air in motion."

There we are: The leading idea that pervades this bulletin is the hallucination of the author's mind that roots breathe, like the other parts of the plant. Beset by this fallacy he works out a string of propositions which would be nice enough if the premises were right. But this is not all. While pretending that he knows that the roots breathe, he also tells us what they breathe. He says that their breathing, like the rest of the plants, consists of taking in oxygen and throwing off carbon dioxide. There is where the calamity howl comes in. For if the bulletin is right we are lost. So far we have been left to believe that the Creator adjusted the matter of breathing between the vegetable and the animal world to such a nicety that each takes in what the other throws off, a sort of balanced trade between them with the atmosphere as the clearing-house. The object of the roots is primarily to give the plants a safe anchorage, and when this is not wanted then such plants have no roots. The function of the roots is solely to provide the plant with moisture and incidentally with the mineral ingredients which the plant needs and finds dissolved in the moisture taken up by the roots.

The chemistry of plant breathing, according to the undisputed teaching of our text books on botany consists in the absorption of carbon dioxide while oxygen is produced and emitted. Our bulletin has it the other way, but we see no reason why we should just now change all of our botany books to conform to that mode.—Ad. Tsheppe, Whittier.

The above quotation is only a part of a communication received from a

valued subscriber at Whittier. In addition the writer referred to the fact that willows grow only along running streams with roots constantly in water also to marine plants constantly under water.

Both plants must have oxygen to live. A fish must have oxygen to live though it secures it from water instead of from air.

Another portion which we have omitted from Mr. Tsheppe's letter is a description of the functions of leaves in breathing and their absorption of carbon-dioxide and releasing of oxygen and the reversal of this process at night. On this point we believe there is no dispute.

Now, as to the author of the experiment station Bulletin, who is Mr. B. F. Floyd of Florida, being wrong we quote as follows from Mr. J. V. Osterhout in Bailey's Cyclopedia of American Agriculture.

"Every living cell must have a constant supply of oxygen in order to exist. The stem sometimes suffers by applications of tar which shut out the air. The roots commonly suffer and often are killed by being deprived of air. This happens when the soil is too wet or when a hard crust is allowed to form on the surface. For the same reason, paving sidewalks or covering the roots deeply with soil may be injurious. When the surface of the soil is loose and sufficiently dry, a circulation of air is kept up within the soil by constant changes in barometric pressure. When this is prevented the soil becomes sour and unfit for plants, and the chemical processes that make food available to the plants are checked. Roots may grow in running water, which constantly renews the supply of dissolved air. Some roots can live in mud, but they are supplied with air by way of the leaves and large air passages in the stems; they are specially adapted to such environment. It is therefore of the utmost importance to maintain a loose, open texture in the soil by proper tillage, to ensure the health and vigor of most agricultural plants."

An additional authority, John M. Coulter, A. M., Ph. D., Head Professor of Botany of University of Chicago says in his book "Plant Relations." During the day, carbon dioxide and oxygen are both being absorbed and envolved. It will also be noted that the taking in of oxygen and the giving out of carbon dioxide is just the sort of exchange which takes place in our own respiration. In fact this process is also called respiration in plants. It does not depend upon light, for it goes on in the dark. It does not depend upon chlorophyll, for it goes on in the plants and parts of plants which are not green. It is not peculiar to leaves, but goes on in every living part of the plant. A process which goes on without interruption in all living plants and animals must be very closely related to their living. We conclude, therefore, that respiration is necessary to all plants in all conditions, and that when it ceases life must soon cease. The fact is, respiration supplies the energy which enables the living substance to work.

"Once it was thought that plants differ from animals in the fact that plants absorb carbon dioxide and give off oxygen, while animals absorb oxygen and give off carbon dioxide. It is seen now that there is no difference, but that respiration (absorption of oxygen and evolution of carbon dioxide) is common to both plants and animals. The difference is that green plants have the added work of photosynthesis."

If our subscriber still doubts these conclusions let him take a valuable orange tree, surround it with a dyke at the outer extremities of the roots and fill with pool of water and keep filled for a month, thus depriving the roots of the tree of air. If the function of the root is solely to anchor the tree and supply moisture such a condition would be ideal. But as a matter of fact the tree would be dead from suffication—lack of air at the roots.

## SUCCESS IN FLORIDA.

Writing of co-operative fruit marketing the Florida Fruit and Produce News says:

It is idle to ask, Will the Citrus Exchange be a success? No one who was present at that remarkable gathering of orange growers which filled the Tampa Bay Casino to overflowing Thursday can have the least doubt as to the achievement of the most sanguine hopes in Florida next season.

There was a feeling of confidence that embued the whole assemblage, a cheerful expression on every counte nance; a spirit of hope that bouyed up every heart, an unusual warmth in the welcoming hand-clasp, a mute expression of brotherly sympathy of which everyone appeared to be conscious, and to which each one responded.

Psychologists might explain this—we simply record the fact—it was there and it was all-pervading.

Every sensitive soul felt that success was in the air, and even those who held back from committing themselves, did so reluctantly. A few unfortunately had prematurely tied themselves up and couldn't come into the game, however much they wanted to do so.

But let no one think that with the officers elected and the agents chosen there is nothing more to do. There is a great deal yet remaining to be done in the matter of organizing the local units, and in this work all can have a part. You who have signed the agreement declared in doing so that you would use your best efforts to organize an association in your vicinity and to bring your neighbors into the light. You can take a copy of the agreement you yourself signed and read it to your neighbor who was not so fortunate as you were in getting at the convention all the wonderful facts so graphically pictured to you by Mr. Reid and Mr. Burton

You who have studied the question and have learned from these experienced men what has been accomplished in California by men situated at one time even worse than you ever were, cannot do your friend and neighbor a better service than to impart some of this knowledge to him.

Freely you have received, freely give. A campaign of education is now before you. Do your part, live up to your light and thus help to make the first year of the Florida Citrus Exchange a notable success and a lasting benefit to our whole state.

## EXTENT AND BASES OF ORCHARD FERTILIZATION.

IN the country as a whole, orchard fertilization is not being neglected. The last census shows that the size of the orchard-fertilization bill is about $2,000,000 per year, according to report of the Pennsylvania State Experiment Station. Fruit farms expended 30c per acre for fertilizers compared with 4c on hay and grain farms and 2c per acre on stock farms. Whether this expenditure is being wisely made or whether it is sufficient is the question. At the present time, we have no exact system of orchard fertilization and little accurate data upon which one may be based.

The systems of fertilization now in operation or recommended are based on four things: (1) analysis of trees and their crops; (2) general experience and observation; (3) orchard surveys; and (4) experimental studies. Each has its strong and its weak points. For example, analyses show that an acre of bearing apple trees takes up about 55 lbs. of potash per year. But the fact that they have this potash does not prove either that they must have it or that its addition to the soil would secure any material response. Indeed, the same analyses show the annual possession by the trees of 57 pounds of lime per acre, and yet lime is not generally considered important in orchard fertilization.

The necessity then for experimental work and close observation on the part of every orchardist is self-evident.

## BAGGING GRAPES.

When grapes are bagged at an early stage there is hardly any work in the fruit line that pays better. It practically assures a perfect bunch. The time to bag them is just as soon as the flowering is over. Many insects and blights are not long in finding out a bunch of grapes, and though a week or two after flowering would be soon enough, in all probability, it is better to do the work as soon as the flowers fade. Almost every one is familiar with the length of a bunch of grapes, and in bagging, all one has to do is to place the bunch inside of a bag of sufficient length, give the mouth of the bag a folding or twisting together and then pin the mouth and the work is done, and the bunch is safe. The closing and fastening of the mouth of the bag exclude fungous germs and all insects, both of which pests destroy whole crops often when not molested.

When the fruit is taken from the bag it presents a beautiful appearance. The berries are covered with bloom, much more so than the best bunches which are produced without them. In many districts more grapes are destroyed by an insect that lays its eggs on the fruit, which later produce a maggot which destroys the berry. Usually such an attack is not confined to a berry or two, but takes every berry on a bunch. Bagging gets over all such trouble, and unless to preserve the foliage from blight, no spraying of any kind is required. The common paper bags, such as the grocers use, are quite good enough for bagging purposes.—Market Growers' Journal.

## MAKE EACH ORCHARD AN EXPERIMENT.

To increase their effectiveness, we urge all who are engaged in the production of fruit as a means of livelihood to adopt the experimental attitude and maintain some portions of their orchards for experimental work. It is self-evident that the best place to determine the crop-limiters of any particular orchard, and to develop and maintain a balanced treatment for it, is in the orchard itself. It is also evident that the surest method is to ask the trees.

This does not mean that one is to become the prey of every passing fancy which may be brought to his attention. But in most matters of importance in the management of an orchard there are two or more courses of action available, between which it is difficult to decide. After careful study of available evidence, he should choose, for the orchard as a whole, the course that in general seems best. But in a small section of the orchard he should carefully try out the other possible courses, side by side with the one chosen. This should be continued long enough to determine for his particular orchard which course of action is really best.

This applies to methods or materials of fertilization, pruning, spraying, soil management, varieties, and indeed to nearly all the essential factors of fruit production. The ideas gained from a knowledge of the methods and results of others will be helpful in formulating the plans of experiment as well as in choosing the course for the orchard as a whole.

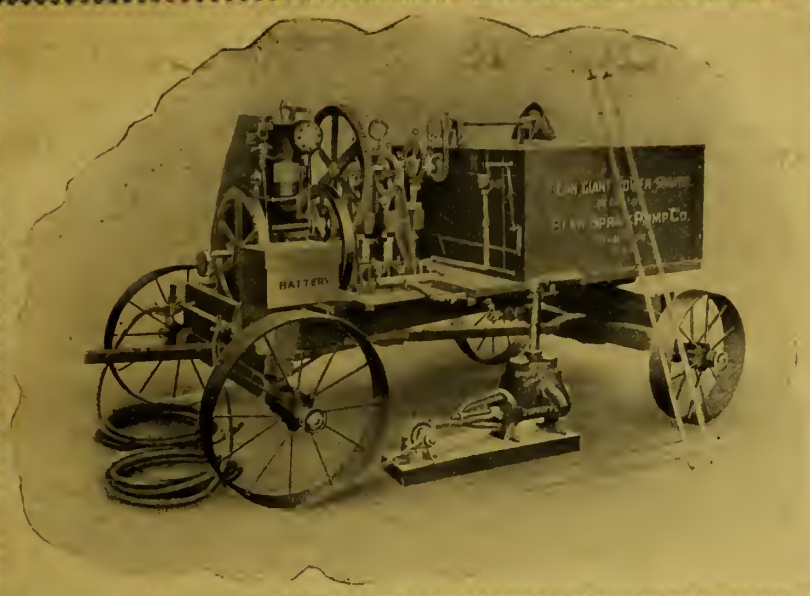
We believe that this course cannot fail to be of the greatest value to commercial orchardists. — Pennsylvania Ex. Sta. Bulletin.

## THE VIEW POINT.

In fruit production, there are several factors that are essential in securing maximum profits. They include location, climate, varieties, soil management, fertilization, pruning and spraying. Each must be right. Of those under man's control, no one can be singled out and made to carry the load of others left undone. Any one or part of one neglected may become the crop-limiter of that orchard and the extra care devoted to the others is lost. The truth of this principle is emphatically shown in figures which we have recently collected in a study of costs and profits in fruit-growing. These figures show that in the case of the apple net profits have actually increased with expenditures up to more than $300 per acre for producing and marketing the crop. Thus in fruit-growing as elsewhere one gets returns exactly in proportion to what he intelligently puts into it. To increase this intelligence, look into one of the most complex of these production-factors, orchard fertilization.

## JUDICIOUS SELECTION.

One great difficulty in our fruit sections has been too many varieties and not enough of one kind. Some varieties may excel others in a few points, yet in the aggregate cannot be called valuable commercially. Some varieties have little to recommend them save their recent origin or the reputation of the originator, or their



# Bean's Giant Power Sprayer

Ready to do constant work at 200 pounds pressure. Has 3 different capacities, which will spray out 200 gallons in from 18 to 35 minutes. Equipped with either wood or steel tanks. A splendid agitator for mechanically mixing distillate or kerosene.

Everything for Spraying

## Bean Spray Pump Company

**212 West Julian St., San Jose, Cal.**

peculiarities or wide divergence from tested standards. It would not seem to be a commendable plan to grow oddities and inferior fruits for the purpose of gain at the expense of the purchaser. Perhaps no one is more truly his brother's keeper than the nurseryman is the fruit grower's. Of course the demand makes the market, but fruit growers are learning to know and demand what is best. We should discourage the planting of varieties of fruit in localities not well adapted to make it valuable. If but one kind of fruit is found to succeed and do well in certain sections of the country, then encourage this specialty. By judiciously growing and recommending the best fruits as well as discouraging the propagation and distribution of inferior ones, we can in a measure shape the planting of our customers' orchards. If we encourage planters to set larger numbers of valuable varieties we are laying a good foundation for future business for ourselves. Others who see the success attending those who set their orchards to a few kinds of fruit, well selected, will be induced to do likewise, and thus the demand for nursery stock will be stimulated from year to year. On the other hand, if we encourage the planting of fruit of all varieties, without considering their value commercially or otherwise, disappointment is sure to come to the planter, and others will not be encouraged to engage in the business, but be driven out of it by these failures. Thus the demand for nursery stock will be decreased. No one engaged in the raising of stock, who is successful, retains inferior and worthless animals as being valuable, but rather is seeking to weed out the poor and produce only the best, that which will bring the largest returns to him. This plan is worthy of adoption by ourselves. We were quite favorably impressed with the advertising put out by one of our fellow nurserymen, in which he states he has no seedless apples, pitless plums or cobless corn to offer, simply the standard money making varieties which are giving satisfaction to all who plant them.—S. A. Miller before Pacific Coast Nurserymen.

### GREAT IS OUR FRUIT INDUSTRY.

The computations of the State Board of Trade show that our output of all marketable products, including forest and mineral products, for 1908 had a value at current prices of $405,115,431, of which $95,012,747 was for fruits and fruit products shipped out of the State, including wine. Of the total value of our fruits and fruit products $23,545,400 was the product of citrus trees and $71,470,347 was from deciduous trees and vines. The amount received from the citrus groves was divided between the growers and those engaged in packing and shipping the fruit, while the sum received from other fruit products went in some part to those engaged in making wine, seeding raisins and canning fruits. It included also the value of the sugar used in canning. Evidently our fruit industries are far and away the most important industries of our State in that they produce the greatest value from a given area of land and afford employment to the greatest number of people. This computation includes only fruit and fruit products shipped out of the State, the estimated value of those sold in the cities of the State being $11,000,000 in addition, making the total value of fruit and fruit products shipped out of the State and sold at home considerably more than one-fourth of all our marketable products.

Next in value to our fruits among farm products is, of course, grain, of which we produced in 1908 to the value of $53,858,124, of which barley was considerably more than half, followed by hay to the amount of $32,229,883, and dairy products $25,224,150. Then follow in the order of importance vegetables, including canned vegetables, poultry, beet sugar and beans. The list of products which we produce on a commercial scale includes all the commercial products of any other state in the Union, except cotton, which is not enumerated, although its commercial production has begun in the Imperial valley. And, in addition to all these, there are the sub-tropical products which have made California so famous.

There is, of course, no other state in the Union which can approach California in the variety of its agricultural products—no other state in which farming is so "diversified," affording to all comers the opportunity to engage in whatever branches of agriculture they may prefer. And, one year with another, one branch is about as profitable as another. The large incomes from orchards represent large investments of capital and continuous labor expended throughout the year on small tracts. It is the glory of California that its climate, its varying soils and, in the north, its abundance of water lend themselves to intensive cultivation. It is only by intensive cultivation that the largest agricultural populations are sustained. There is no other state like California.—S. F. Chronicle.

### NATIONAL NUT GROWERS.

The National Nut Growers Association will convene in annual session in Albany, Georgia, October 12, 13 and 14.

The application of lime to orchard land is often a matter of urgency. In addition to its being a plant food, lime is most important as a corrective of acidity. In heavy soils well supplied with humus and fairly drained and cultivated, fruit trees often fail to thrive, owing to a deficiency of lime. Rather frequent and light applications are preferable to the old plan of a heavy dressing about every five years. From three to five cwt. per acre, though some recommend 1500 or 2000 pounds, is a fair dressing for rich land deficient in lime. It should be applied in winter after the soil is plowed and be harrowed in, a freshly slaked and finely pulverized sample being most effective.

## THE UDDER AND TEATS OF THE COW.

THE first flow of milk may bring severe swelling of the udder and after the usual remedies have been applied and the worst of the trouble is past, there may remain a hardened condition. These cases, have usually been treated by giving salts and fomenting the udder with hot water, the treatment not continued long enough and the trouble permitted to become chronic. This is usually the condition when the wife becomes annoyed with the milk in the house having strings and clots in it. The following liniment can be put up the by the druggist and has proven excellent for these troubles.

Tincture of Iodine 2 oz.
Tincture of Opium, 2oz.
Alcohol, 8 oz.

Give the cow half a pound of salts every night to keep the howels well opened and feed on dry feed to reduce the milk flow until the trouble is past. While these cases are quite curable, a portion of the milk flow will be lost until the cow again freshens.

**Sore teats.**

Where cows lie down in the mud or in their own excrement, the ends of the teats may become sore and form scabs. This is annoying as it makes the cows fretful, lessening the milk flow by the nervous tension. The feature of the disgusting nature of using milk that has passed over sores into the pail is another part of the story and is not considered here. We are now thinking only of the cow's side of the tale. This trouble is sometimes mistaken for cow pox as it seems to pass from cow to cow. The stables must be cleaned and disinfected carefully to prevent the cows from reinfecting themselves. Soak the ends of the teats in warm water and after removing the scabs paint the surface with tincture of iodine. After each milking wash them in warm water and apply a saturated solution of boric acid. When dry put on benzoated oxide of zinc ointment. Three days of careful treatment will cure this trouble.

**Warts.**

These are annoying and yet are easily removed. Those having long necks or pedicles may be removed by clipping them off one at a time with sharp scissors and then touching the spot with lunar caustic. Taking one each day after the morning milking on each teat will not make the teats sore. When the warts are broad at the base they may be covered, after washing them clean, with cold pressed castor oil. Another remedy is to apply to the clean teats, touching only the warts with a small brush dipped into the lotion:

Acetic acid, 4 grams.
Salicylic acid 4 grams.
Spirits of ether 3 grams.
Collodion 16 grams.

**False Openings.**

The teats are often injured when the cows are in stanchions, by being stepped on by the next cow, and in healing an opening is left on the side of the teat. Then sometimes a heifer will have naturally a false duct in the side of her teat. When the trouble has not been from injury but from a natural cause, it is best to leave the cow alone until she goes dry. Then scrape the sides of the opening until it is raw, bring the edges close together and bind with a piece of adhesive plaster. Cut the plaster into narrow strips and put it over the wound in a series of X's, being careful that the cut surface is completely covered at the crossing of the X. If the cow is in milk and receives an injury, then the same process must be used. In both cases use the lead plug to prevent the true duct from filling with granulations. When the cow is giving a large flow of milk it it better to put in a milking tube and let the milk drip away until the healing is completed. However this use of the milk tube is only for bad cases, as it may produce relaxation of the sphincter muscle that closes the teat to hold back the milk. It is very

annoying to have a cow that leaks her milk constantly.

**Double Teats.**

Heifers are sometimes found that have double teats or the two teats cased in one skin. The surgeon must separate tbese clear up to the quarter of tbe udder. Unless an animal is very valuable it is just as well to send a cow like this to the butcher. Sometimes the supernumerary teats just back of the true teats, have a duct connecting with the back part of tbe udder. These the surgeon will close by cauterizing them and making them granulate. These extra teats rarely give any trouble and are regarded as indicative of great milking capacity. They frequently decorate the sire as well as the dam of some of the best herds.

**Bloody Milk.**

A fresh cow may give from a quarter of her udder milk containing blood. This trouble in many instances passes away as soon as there is less engorgement of the udder. As a preventive the cow should be milked every eight hours or three times a day until the first great rush

## NEW DAIRY AT UNIVERSITY.

The plans which are being perfected in California for enlarging the usefulness and effectiveness of the division of Dairy Industry contemplate the addition of several men to the force. The first appointment for the coming year is that of Mr. L. M. Davis of Kansas. He is a recent graduate of the Kansas Agricultural College, having given special attention during his course to the subjects of dairy manufactures, chemistry and bacteriology. He comes to California with an excellent recommendation as a careful conscientious investigator. For a time he will be at Sierraville and Loyalton where his attention will be given to a study of California cheese making. Later he will visit other parts of the state in order to familiarize himself with conditions before the opening of the fall course. The making of the so-called California cheese is an important industry and it is hoped to give definite instruction in this art at the Dairy School during the coming year. Butter making will also come in for a share of Mr. Davis' attention at the University Farm, where be will be stationed.

of milk is over. The use of tonics for this trouble is a waste, for it is as purely mechanical in the healthy cow as the running over of a pail of water when it is too full. The small blood vessels of the udder are too full and cannot longer hold their contents until it is elaborated into milk, and so discharge the blood directly into the milk. If the cow is healthy the blood is not injurious, and by allowing the milk to stand until the blood settles to the bottom of the pan, the milk may be poured off leaving the blotted blood behind. By observing which portion of the udder the bloody milk is secreted by, that portion can be milked into another vessel and fed to the calf.

The only bloody milk to be feared comes from a diseased udder. This is very rare, fortunately. By examining the milk for pus it may be distinguished readily.

Pus is a white mucous looking substance that sinks in water. If anything like this is discovered in the milk, it should not be used even for feeding the calf or pigs until the cow has been tuberculin tested and pronounced free from disease. If she passes the test and still gives milk containing pus, this trouble is too serious to be contended with and she should be fattened and turned off for beef.—M. E. Sherman.

**Do your cows milk hard? Send 50 cents for teat expander. .O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

## DAIRY BACTERIOLOGY.

We have received from Ginn & Co. a copy of "Experimental Dairy Bacteriology" written by Messrs. H. I. Russell and E. G. Hastings. The book is largely tecbnical, and yet no more so than it should be for the dairyman who would have his products in line with the demands of the present day. It touches upon the technique of the industry; contamination of milk, fermentation, preservation, bacteria aiding in butter and cheese making, milk hygiene, etc., and contains a number of chapters of great value. The mailing price is $1.05 and the book may be ordered through the Cultivator office.

## DAIRY NOTES.

Your well bred cow if kept in good condition will respond to feed when giving milk. It is well known that certain foods are milk producers.

On a pasture of green grass the flow will continue much longer than on hay, hence it becomes necessary as the pastures dry up to supply that which most nearly takes the place of green grass. Those fortunate enough to be located near a sugar factory can easily obtain a succulent food at comparatively slight cost.

A prominent dairyman who, if possible, feeds pulp the year around, makes the statement that "sugar beet pulp is the mainstay of the dairy business."

The most profitable milch cow is the one that comes the nearest to milking the year around with only the proper interval before again becoming fresh.

Unless exceptionally high prices are paid for it, milk is fully as economical a source of nutrients as other animal foods, but dearer than most staple vegetable products. Milk, however, requires no preparation, has no waste, and is more thoroughly digested than most vegetable foods. As a source of protein, the most expensive of the nutritive ingredients, it is especially economical. Skim milk, which is whole milk minus part of its fat, and which costs only half as much as whole milk, furnishes protein about four times as cheaply as beef. Foods prepared with either skim or whole milk are much more nutritious than those prepared with water.

To hogs alfalfa hay is usually fed dry. The leaves are more readily eaten than the stems, as they contain more of the nturitive value of the plant. For this reason some farmers save the last cutting of hay for the hogs because it is more relished. It is eaten up cleaner, as the stems are not so woody, and more food value is found in the leaves Sometimes the hay is cut up fine, wet, and mixed with other feed, and sometimes it is fed ground, as there are now alfalfa mills scattered throughout the alfalfa regions.—From Coburn's "Swine in America."

# The Passing of the Milk Factories

**has been caused by**

## The Universal Adoption of Cream Gathering

The Vermont Farm Machine Company are the pioneers in the cream gathering system. This cannot be successfully denied.

The farm or dairy sizes of the **United States Cream Separators** made such headway that the proprietors of milk factories, against their will, had to change. **The farmers demanded it.**

Not **10 per cent** of the whole milk factories of nine years ago are running today, as such. They have either closed up or changed to cream gathering, the more economical plan. Our "would-be-competitors", who are always "claiming the earth", cannot deny this fact.

These "would-be-competitors" had been supporting the whole milk scheme and fighting the progressive cream gathering system. When they saw that their efforts were futile—that the change was bound to come—they tried to save what they could out of the wreck.

If you have read their big blustering advertisements containing testimonials from creamerymen, you have noticed that nearly all admit they changed from whole milk and took agency for farm separators of this particular "would-be-competitor", because of the **large commission allowed to the creamery on the sale of their Separators.** The creamery made more money out of them than they did on the cream. Some went so far as to refuse to take cream from any separator which they do not sell and get the commission on.

This worked for a time, but the farmers were **too intelligent to be bulldozed** in this way. They insisted on having the BEST separator. All these creameries tacitly admit that they had to give up their exclusive agencies and take cream from the United States Separators.

**Several events forced them to it. Their pet separator was beaten in the greatest International skimming test ever held, in endurance tests running over thirty days.**

**The United States Separator also beat this pet separator** in the county where its factory is located; and in that county for ten years the United States has averaged more than **three separators** to every one of this "would-be-competitor's".

Figuring on the same basis as our "would-be-competitors" figure their profits, it puts **seventy-five dollars a year into the farmers pocket** if he uses a United States Separator instead of this "would-be-competitor's" separator.

A United States Separator catalogue, which can be had for the asking, explains all these things fully.

## TRANSPLANTING.

IN transplanting, pull at one time only as many plants as will be required for part of the work. Keep the roots of the lifted plants away from the drying effects of sun and air. The feeding roots of young plants are very fine and delicate. A few minutes' exposure to the air will often so completely dry out some of them that the plants will perish. It is best to keep them covered with wet cloth while the work is progressing. If very little soil is adhering to the roots, immerse the roots in thin mud for protection. This process of immersing the roots of plants in thin mud is called "puddling," and is highly commended in transplanting, especially with large plants, such as shrubs and trees. Of course, some plants bear transplanting much better than others. With some, little care is needed, while with others much care is essential. One must learn by experience which ones are hardy and which ones are tender.

Pour water in the hole in which the plant is to be set, place the roots in this hole and draw in the finest soil that can be reached. Press the soil down firmly about the roots with the hands and afterwards with the feet. Then rake fine soil over the surface for a dust mulch to prevent evaporation of moisture at the surface. Aim to keep the soil moist below, but dry and loose on top.

Since some feeding roots are destroyed, it is always well to trim off a part of the leaves to reduce loss of moisture by transpiration. The entire top of some plants may be pinched off or cut away, leaving only a few leaves to carry on life processes. As soon as new roots grow and push down and out into the moist soil, new buds will develop and new leaves be produced.

If, after transplanting in this manner, the air and soil should become very dry or the sun shine hot so as to dry out the plants, cover them with newspaper. Some cover them with glass jars or other vessels, but this is not good practice. Glass draws too much heat and any close vessel shuts out the air necessary for health and growth. In dry times water the plants every evening till they become well established. Raking the surface soil about the plants with a fine-toothed rake will help to retain soil moisture as it ascends from below, often obviating the necessity of artificial watering.—Journal of Agriculture.

## HOW TO GROW LARGE FRUIT

I have been asked how I grow such large fruit for exhibition, and this is my reply: For strawberries, I select large plants, pinch out fruit stems, leaving two of the best. After bloom drops, pinch off berries, leaving three to five of the best. Set a tin can on each side filled with liquid manure. This liquid can be made by filling a barrel about two-thirds full of manure, poultry manure is best, and fill barrel with water to leach off like lye from wood ashes or it can be dipped out of the barrel. Fill the cans with this liquid every few days. Punch small holes in the bottom of the can for the liquid to run through slowly.

To grow large raspberries and blackberries select large canes. Cut off all canes with about two feet. After bloom drops pick off berries, leaving about one-fourth the largest. Set cans close to them as described for strawberries.

For tree fruit, select suitable branches and when fruit is about one-third grown pick off, leaving enough for about half a crop. Wrap wire closely around the limb between the body of the tree and fruit. This causes the fruit to grow over natural size, but it should be remembered this is death to that limb, so branches for that purpose should be used which we want to prune off next year. The size of fruit can also be increased by mulching manure or watering with liquid manure.

## THE VEGETABLE GARDEN.

Make the vegetable garden a long and narrow strip where it can conveniently be done, rather than to have a square block because the long-shaped piece of ground can be worked with the teams to better advantage. The progressive farmer and gardener uses horse instead of hand labor wherever possible, each individual case, however, governing according to circumstances.

Plow the ground and pulverize with harrow and disc, repeating the operation at intervals of a week to ten days, or after a rain. Enrich thoroughly with any required fertilizer, according to condition of the soil. See that the patch is either naturally or artificially drained. Repeated diskings until time of sowing the garden seed or up to the time plants are set out will save much work at weeding and cultivating subsequently. The same principle applies whether horse or hand tools are used.

It is better to continue pulverizing the soil, as may be required, until time of growing temperature.

Let the ground become warm enough for plant growth, then sow seeds of the hardy classes as pease, onions, cabbage, etc., or set the plants when previously grown in boxes. In many cases crops may be produced with scarcely any after cultivation from time of planting when the ground has been put into the proper condition previously. It always pays to do the preparatory work beforehand.

## A CURE FOR MELON BUGS.

A very successful market gardener told me last fall that he had a sure cure for the little striped melon bugs. He said he had paid $10.00 for the secret and it had been worth $100.00 to him since. It was nothing more nor less than a liberal use of bone dust or bone meal around the plants. He says it will absolutely drive away the striped bugs when everything else has failed. I have not yet had a chance to try it myself, but it is possible that he is right. If so, it is a valuable idea. The bone dust will be a good thing for the plants, anyway, whether it drives away the bugs or not for it is a rich fertilizer. It can be had from any dealer in fertilizers at a cost of probably $3.00 per hundred pounds.—St. Jo. Fruit Grower.

Successive seeding of radish, peas, beans and lettuce will provide these vegetables throughout the summer and fall season.

# Eucalyptus Seeds

In large or small quantities, 33 kinds to select from. Write for free pamphlet "Eucalyptus Culture." It gives full directions for sowing the seed, raising the plants and planting out into the field, together with descriptions of all the leading species, giving their uses and the localities to which they are adapted. Sample packets 15c each, 2 for 25c, 4 for 50c, 9 for $1.00. Choice Flower, Garden, Tree and Palm Seeds, Roses, Flowering Plants etc. Catalogue mailed free upon application.

### THE BEST SORTS TO GROW.

THE ROSE has always been held in the highest esteem by lovers of flowers. Its variety of color, form and exquisite fragrance justly entitle it to the first place among floral treasures.

But many are deterred from enjoying this favorite because of the seeming difficulties in its cultivation. The belief is prevalent that on account of its tenderness, lack of vigor, and liability to the attacks of diseases and insect foes, this beautiful flower cannot be grown successfully except by expert cultivators. Others think that the rose blossoms only once during the season, and that the plants, after flowering, are not only unattractive but objectionable; hence it happens that many who should have an abundance of roses in their gardens must, by force of circumstances, be deprived of the great pleasure.

The satisfaction of having a bed of roses almost constantly in bloom, equaling in beauty and effect a bed of geraniums or foliage plants, can be realized, in the writer's opinion, by a judicious selection of kinds and by proper treatment of the plants, an operation which is not necessarily difficult or troublesome.

The prospective pleasure, too, of being able to pluck from the garden every day during the summer a bouquet or an armful (according to the number of plants) of these charming flowers for home decoration or for distribution among one's friends, will perhaps induce the reader to note the suggestions herein made, and to attempt at least to become enrolled among those who are recognized as successful cultivators of the queen of flowers.

Within the last few years, through the efforts of hybridists, new varieties have been originated which have greatly enlarged the list of so-called everbloomers, and at present a selection can be made, which with ordinary care, is sure to give the most satisfactory results. In years past we had to depend mainly upon a few Bourbons, Bengals and Chinas for the purpose mentioned, none of which can be said to have given the satisfaction or pleasure which was anticipated. The plants were not vigorous enough and the flowers were not sufficiently atractive to win admiration and encourage efforts to cultivate them.

The basis of successful rose-growing is rich soil, ordinary good garden soil, well-drained and thoroughly and deeply spaded, enriched with manure or fertilizer. The soil can hardly be too rich, but the manure must be decayed and thoroughly incorporated with it, and the plants must be set in the soil, not in the manure as it is sometimes done. Well-decayed sod, prepared in advance and forming a compost, is a valuable addition to garden soil. Careful preparation of the soil in advance of planting, will amply repay the care taken.—W. C. B.

### HOW TO SELECT SHRUBS.

Shrubs as a rule are intended as a frame for the yard or garden. They are planted around the borders of the lawn, or used to screen the foundation of the house, or to fill in corners.

The shrubbery frame for the yard or garden should be formed on the same principle as a picture frame, the border of a rug etc. It should harmonize with the picture it encloses, and each shrub in the border should harmonize with its companions. Too often no attention is paid to this kind of harmony and the shrubbery border becomes a thing of shreds and patches, made up of showy bushes, perhaps beautiful plants in themselves but arranged without regard to the effect of the shape, color and general appearance of one upon the whole.

In choosing shrubs to grow side by side consider the foliage and flowers as carefully as you consider the size and shape of the bush. Do not put large masses of dark, or you will have a patchy effect. By care in selection as regards flowering season, you may be sure of having one or more plants in the border in blossom at all times during the summer. Two shrubs that blossom at the same time should not be placed together if the colors clash. In the summer study your shrubbery border and make notes as to new plants needed, their color, size and flowering season, and also what old plants may profitably be moved. These notes will enable you to work accurately in the fall, after the blooming season, or in the spring. Care in selecting and arranging the plants in your home grounds will never be regretted.—National Council of Horticulture.

### CHRISTMAS FLOWER SWEET PEAS.

Within the last few years there has been developed or hybridized a class or specia of Sweet Peas that are early blooming in character and are used by florists for "forcing" during the winter throughout the East, and are very popular. Through the milder or warmer sections of California they can be planted during August and September and will bloom all through November and December, and in fact all the winter without protection.

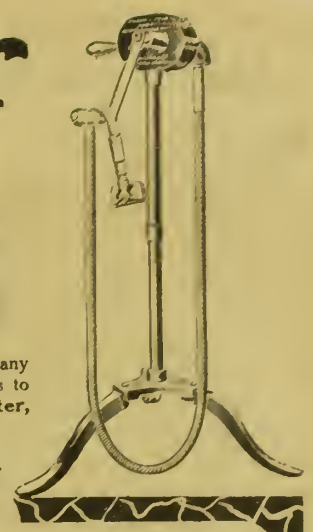
Of this class there is yet a limited number of varieties, but most of the colors are represented.

A list of the best varieties are as follows. The Earliest White, originated at Ventura by Mrs. Gould, which is a sixty day variety. Bodger's Earliest Pure Pink, introduced by the Morris & Snow Seed Co., who control this variety. This one proved the hardiest of all varieties last season. Earliest of all, a very good pink and white sweet pea and a very popular variety. Christmas Pink, a pink and white variety. Mrs. Alex. Wallace, a clear lavender. Christmas Red, a clear scarlet.

After sowing, providing the soil has been thoroughly soaked before, all further watering must be withheld so long as all seeds are not up and as long as there is any moisture below three inches of soil. This encourages the young plants to hunt deep for their food and moisture and prevents their damping off in hot spells. When really necessary, give a good watering only between the rows and away from the plants.

During hot weather syringing is good. As soon as the peas are up, look out for the green fly; they are apt to be right there. By syringing with Tobakine (one teaspoonful to a gallon of water), the plants can be kept clean if done in time. After the Sweet Peas are in full crop, a watering once a week with cow manure liquid will improve the flowers, or by using a small quantity of blood meal or nitrate of soda the size can be greatly improved.—O. M.

**Clip Your Horses Yourself**



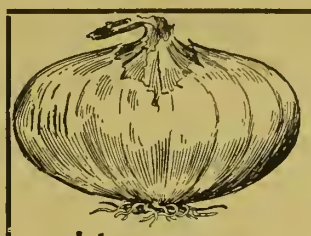
Stop paying high charges for work that you, or any man or boy, can do. There's no need to employ experts to clip your horses when you can clip them **yourself better, quicker, cleaner, safer and cheaper** with a

**Stewart No. 1 Ball Bearing Horse Clipping Machine**

It's an economy for the man who owns one or more horses. For, with a STEWART, there are no delays. The machine is always ready for use. Horses can be clipped more frequently and at Regular Intervals. The STEWART is *the* machine that lasts indefinitely and gives good service *all* the time. It never requires attention, and runs practically without friction or wear. A tremendous speed of the knives is obtained by slowly turning the handle—and a boy can turn the handle. (Another boy can clip the horse.) **Complete for $8.50.**

The price is for the machine ready to begin clipping horses with. It includes six feet of flexible shaft, the famous Stewart Clipping Knife and a liberal guarantee. Get one at your dealer's. If not there, write us.

CHICAGO FLEXIBLE SHAFT CO., Dept. H CHICAGO



**Imported Bermuda Onion Seed**

Our Bermuda onion seed is the finest Teneriffe grown stock, gathered from select large bulbs. We import it ourselves, direct from the Canary Islands, and we thoroughly test it for perfect germination before we offer it to our trade. If you intend to grow onions this season, it will pay you to buy your seed from us and get the advantage of our direct importing and scientific testing. We have an import shipment due here August 20th. Orders should be placed now.

White Bermuda Seed, oz. 25c; ¼ lb. 75c; lb. $2.50.
Red Bermuda Seed, oz. 25c; ¼ lb. 75c; lb. $2.25.
Crystal Bermuda Seed, oz. 30c; ¼ lb. $1.00; lb. $3.50.

**Winningstadt Cabbage Seed**

For August and September sowing the Winningstadt Cabbage is unquestionably superior to all other varieties. The hearts are firm, full size and of very fine delicate flavor. The crop comes in for cutting very early in the spring. Our seed is all French grown and we carefully test it for fertility.

Oz. 20c; ¼ lb. 60c; lb. $2.00.
Special prices on larger quantities.

**Aggeler & Musser Seed Co.** 113-15 No. Main St., Los Angeles, Cal.

**Onion** White Bermuda, Red Bermuda, Crystal Wax, New Queen. Now is the time to plant early onions in the Great Inland Valleys of Southern California. And we would especially call your attention to our line of imported onion seed. They are all True to Name and "Full of Life." Get our prices on large quantities.

**Try Us on Cabbage Seed—We Have the Goods**

### TRAINED BUSINESS MEN.

The farmer is coming to be more of a business man than he was years ago. He has more grasp of business demands, and through the hard knocks received in marketing his products has had his wits so sharpened that he stands a good chance with the trained business man of the cities. But he should not expect to leave the plow and engage in the unequal contest of the marketing of large quantities of products without due preparation.

Only a few days ago the Cultivator received a letter from a section now forming a co-operative marketing association. This letter asked various questions as to details of packing a certain kind of fruit, etc., all entirely proper questions, but indicating a start in a line of co-operation which we believe, can only end in failure. When the producers raise their crops and pool their fruit, they have done the share for which their life time of training has fitted them. Their shrewdness should then impel them to secure equal skill in the line of marketing. That should be the motive of co-operation.

It must be admitted that many farmers look at the matter of marketing as of small consequence and one that any man with horse sense can attend to. This is true at times, but at others, far from it. If co-operative effort is to succeed it must have the benefit of shrewd marketing. The farmer often looks with distrust on the business man who demands a salary in excess of what the farmer knows he himself can earn, but ability must be paid for and it will give a good return on the Investment. Bear in mind we say "ability." Often ability and business judgment is claimed, but the goods not delivered.

### ORIENTAL LABOR.

Commenting on the attitude of Col. John P. Irish on the Jap labor question, in which he advocates oriental immigration on the ground that the chief need of California is farm labor, the Fresno Republican says:

"Not so fast, colonel. The chief need of California is farm owners. When the big estates of California are largely cut up into "one-family" farms, on each of which lives a hard-working man with his family, there will then be population enough in the agricultural district, to do the work of those districts. One of the best ways to hasten that consummation is to keep Oriental laborers away from the land owners who can not profitably farm their land without them. It is not at all imperative that these large farms make a profit. In fact, it is quite Imperative that they make a loss, if the only way to make them profitable is to undermine the racial civillzation of the state. Probably it will not be so bad as that, but it is likely to become increasingly advantageous to farm lands in small tracts rather than big. Then the big man will have the choice of selling his land at a profit or keeping it at a loss.

"Colonel Irish has been preaching this doctrine for years, and occasionally he has hypnotized a convention of short-sighted farmers into thinking they agreed with him. What Colonel Irsh needs is some bifocal glasses, for his mind's eye, so that he can see far as well as near. Then he will know that every dollar made or gained by Oriental labor now means many dollars, and more than dollars, lost to our race and our civilization later."

### BETTER DRAFT HORSES.

For several years stock raisers have shown apparent fear of over production of horses. At one time the bicycle was going to greatly lessen the demand; later the automobile surely would, for it soon adapted itself to heavy trucking as well as to lighter road travelling. Again, the extension of the uses of machinery added to this apprehension. All these influences have resulted in greatly reducing production, or, to be more exact, proportion of production, of horses. There has been an actual increase, but it has by no means been proportionate to the increase of population, which has amounted in the last fifteen years to 33 per cent while the increase in horse production has been less than 23 per cent. Prices have raised in greater ratio. It is not unusual for a good draft horse to sell for from $350 to $500 in the large cities, and a well matched team will at times bring $1000—and this not only in single instances, but sometimes by car lots. As much as machinery may come to take the place of draft horses and road horses, there will always be a certain demand which only the most faithful servant of man can fill.

### PETROLEUM BUTTER.

The farmer has for a long time depended upon the Standard Oil Company for axle grease to make the wheels go round, and for many other necessities. Now it is rumored that the Standard Oil Trust is to enter into competition with the dairymen of the country and manufacture "petroleum butter." We presume this report is somewhat in the nature of a joke, but Standard Oil has manifested a disposition to corral everything in sight, so we may lend some credence to the story. An Eastern paper says of this departure: "From petroleum we get axle grease and phenacetine, dyestuffs, and monopoly, vaseline and philanthropy, benzine, kerosene, gasoline, billionaires, restraint of trade, pipe lines, tank cars, tank ships, tank wagons, Sunday schools, sermons and commercial precedents. So why not butter?"

### AMERICAN BREEDERS ASSOCIATION.

The Sixth Annual Meeting of the American Breeders Association will be held in Omaha, Nebraska, Dec. 8, 9, 10. At that time a National Corn Show will be held at the same place. Producers of live stock and producers of plants will unite in discussing the principles of heredity. The secretary of the association is W. M. Hayes, Washington, D. C.

### PROTECTION FROM LIGHTNING.

We have received a circular from the Department of Agriculture stating that from 700 to 800 people are killed, twice as many injured and considerable property lost each year in this country through the effects of lightning. The circular then goes on to say that the Department has issued Bulletin 367 explaining how it happens, how to prevent buildings from being struck, etc. This may be of interest to our Eastern friends. We merely mention it that Californians may appreciate the blessings of living in this wonderful country. It is perhaps true that there have been people killed by lightning within the bounds of this state—we recall one nearly 20 years ago, but have heard of none since—and such instances are so exceedingly far apart that we may say the state is practically exempt. Many in the East wonder how we can feel safe to live in this country of fearful earthquakes, yet the 700 or 800 killed over the East by these storms every year is a far greater number than those killed in a score of years by earthquakes on the Pacific Coast.

### GOVERNMENT PURCHASE OF CROPS.

The experiment of the government purchasing crops of producers is being tested in Brazil. The state of San Paulo, where much of the coffee used in this country is produced, in order to prevent producers selling at an exceptionally low price when compelled to unload the crop at once, advanced funds and stored the coffee. This assurance of at least fair returns so increased the production that if it had been forced on the market the immense quantities stored by the government would have broken the price, and the suggestion was made that one entire season's production should be burned.

The government has already borrowed seventy-five million dollars to conduct this experiment, and finds it can go no farther. This may prove very expensive to Brazil, but is being watched with considerable interest by producers in other countries.

### STREET PLANTING.

Th managers of a large tract of land near Riverside are beginning right in one respect. They have secured a large body of land which is to be sub-divided and sold in small ranches to home makers. Good land was secured and abundant water is to be piped, but one of the first steps taken after these two factors had been arranged, is the beautifying and parking of the roadways. For this purpose they have secured Mr. Q. A. Lobingier, for several years writer for the Cultivator, and Mr. Lobingier is now at work formulating plans. We believe that his work will add greatly to the attractiveness of the home acres which are being subdivided.

### SAVE THE BIRDS.

The first page article this week, which is taken from an address delivered at the National Irrigation Congress at Spokane, contains some interesting reading. The writer maintains that conservation of our resources looks beyond the lumber yard, the coal mine and the iron supply, and he shows wherein our little feathered friends may be of great value to the farmer. This, of course, is no new theory. It has been talked for years and years, but this manner of placing it before the people is perhaps valuable at this time.

## Business Notes

Almost every mail brings to this office pleased expressions from subscribers who find in the Cultivator their money's worth or better. The latest along this line is from Mr. John R. King of Whittier, who says in remitting his dollar for another year's subscription, "The Cultivator is worth ten dollars a year." Among our most enthusiastic friends is Mr. F. W. Marvin of San Francisco, who writes under date of August 1st, "I came across your paper full of news and information. How you can publish such a paper at the price, I don't understand, as the information I found in the two copies I saw, is worth many dollars to me even now. I really haven't the cheek to send you one dollar, so send you two for two year's subscription and in fact came near making the check for five dollars instead of two. I am not a farmer but a merchant, but am sure your paper will be more than welcome in my house."

# Agricultural Notes of the Pacific Coast

## Northern California

Biggs has shipped 180 cars of deciduous green fruits.

Hop picking began at Wheatland August 10th with a thousand pickers.

Pear blight is doing more damage than for some time in Nevada County.

Butte County will have an exceptionally large output of dried prunes this year.

Yuba City growers are receiving $20 per ton for their Thompson Seedless grapes.

The pea crop of Humboldt county has been almost a complete failure this year due to aphis.

The contest is still on between the agriculturists and the dredge miners, and still the damage is being continued.

Prof. Wickson has suggested that Luther Burbank be secured to conduct a school for the study of horticulture.

Johnson grass is spreading in the Yuba City slough and farmers are urging a strong movement be started to eradicate it.

The condition of the Sacramento River is worse for navigation than it has been for many years owing to sand bars and snags.

The Santa Rosa Chamber of Commerce is exhibiting a large number of varieties of plums grown on the Burbank experiment farm.

Hay sown on land which had been overflowed in Contra Costa County made a good crop which was cut two months after seed was planted.

The skimming station of the United Creameries at Arcata has just been completed. It is to take the place of the old plant burned on June 16th.

A farmer from the land of Palestine is investigating farming methods at Chico, hoping to gather information which will be of value to his people.

The immense ice and pre-cooling plant at Roseville built only a year ago is already proving too small and it is probable that its early enlargement will take place.

Humboldt County will hold two fairs this year, one at Eureka and one at Ferndale. The Ferndale fair will be from September 6 to 10, and the Eureka fair from Sept. 12 to 17.

The shortage of cars in the deciduous fruit shipping districts has been largely relieved by the special rush order to push empties to the western end of the line as rapidly as possible.

The Farmers Protective Association has been organized at Anderson and will endeavor to have discontinued the nuisance of smoke from smelters, which is causing great damage to crops.

An expert planting assistant of the service has been permanently detailed to work in the Shasta National Forest. His work will be principally in overseeing planting stations for nursery forest trees.

The Woodland Creamery has 225 patrons and is making 1500 pounds of butter now. Best days in winter they make 2500 pounds. There are two other creameries represented there with about 45 patrons to each. There are a few over 300 dairymen about Woodland.

## Central California

Hanford has a sewer farm which is proving profitable.

The Corcoran sugar factory is crushing 250 tons of beets daily.

Morganhill small ranches are rapidly being taken up by Easterners.

Work was begun a short time ago on the fruit packing shed at Turlock.

The farmers union has established an office in San Francisco at 214 Front Street.

The number of farms in San Joaquin County has increased by 536 in the past year.

The San Jose Grange at its recent meeting discussed the best method of curing prunes.

Tulare lake is much higher than usual at this time of year and has been rising recently.

It is reported that the sales of canned fruit are 350,000 cases ahead of this time last year.

Kern county will ship about twelve carloads of honey, which is much short of the normal crop.

U. G. Strader a breeder of Dutch belted cattle at Ceres, will make an exhibit at the A-Y-P Exposition.

Hanford peach dryers report that four cents is as good a price as has been offered them for this season's output.

It is now expected that the capacity of the Corcoran sugar factory will have to be increased before another season.

Thompson Seedless men at Exeter are receiving better returns than last year, but the shipments are not nearly so heavy.

The Santa Clara cured fruit association has opened its packing house for the season's fruit. It is now running on apricots.

A number of Mennonite colonists have been inspecting land in Kern County in the hope of finding suitable lands for home makers.

The Kern County Fair which will be held in Bakersfield the week beginning September 6th, is receiving continued demands for space for exhibitors.

Santa Clara has over 4000 men, women and children employed in her canneries. These canneries will put up over a million cases of canned goods this year.

Several sections of Central California are infested with what is called European foul brood. Strenuous work is being done to keep it subdued as much as possible.

The Farmers Union at Campbell, Santa Clara County has received a shipment of machinery which will be installed in the new packing house, which will be ready for prune shipments.

Rumor has it that there is a packers' war on between the shippers of raisins in the Fresno section. It is hoped that the producers will get their just deserts if the scrap does materialize.

Some contention has been stirred up in Tulare County because some have claimed that Mr. Miot, in charge of the exhibit at the A-Y-P Exposition, is not impartial in advertising various sections of the county.

## Southern California

The Oxnard Sugar factory is receiving about 2500 tons of beets daily.

The entire Colorado Desert section was visited by a heavy rain storm last week.

Three hundred hands are constantly employed in the Waters Cannery at Pomona.

The Lemon Men's Club of Southern California will meet in San Fernando September 11th.

Some Coachella Valley alfalfa growers have found satisfactory returns in producing alfalfa seed.

The Azusa Irrigating Co. is constructing a new reservoir upon recently purchased property.

Large shipments of hay are being made from San Fernando, ranchers receiving about $13 per ton.

Escondido is planning for an extensive exhibit of all her fruit products at the coming grape festival.

The lima bean growers of the San Joaquin ranch, Orange county, will affiliate with the Ventura association.

Large portions of the Lucky Baldwin ranch near Los Angeles are being sold off in small parcels to farmers.

San Jacinto promises to exceed 200 tons with its pear crop this season, which is of exceptionally good quality.

The Upland Heights Orange Association is the name of a new co-operative marketing association at Upland.

The Southern Pacific Railroad will lay a spur from its track in Santa Paula to the lemon ranches east of town.

Riverside orange growers are already considering the advisability of more complete preparation for frost protection.

The Riverside horticulturists have adopted resolutions favorable to Burbank and condemning the action of the Pasadena Gardeners Association.

The largest onion seed ranch in California is that of G. A. Murdock near Westminster. This ranch is now sending out carload lots of onion seed.

The lima bean crop of Santa Monica, Los Angeles county, is promising an exceptionally good return this year. The season has been very favorable.

The Ventura County Bean Growers Association has entered into an advertising scheme at the Seattle Fair where thousands of folders have been distributed.

The benefit of organized fire fighters was shown in a foothill fire near Santa Ana, when a fire that swept 200 acres was brought under control by back firing and fighting with shovels.

Ventura County will ship 170 cars of dried apricots which will bring to that section something over a half million dollars. The return to the county for pits alone will almost reach the figure of $150,000.

The large irrigation company which is about to take up the plan of damming Lake Elsinore, is corraling a large number of power plants in Southern California, and it is claimed a large electric power trust is in contemplation.

## The Coast

Dry farm crops of Utah are making the best yield ever for that state.

The Interstate Fair and Exposition will be held in Denver, Sept. 12 to 18.

Idaho barley growers are receiving a cent a pound for their growing barley.

The crops of hops in Oregon will aggregate about one hundred thousand bales.

The first car of wheat to be shipped from Colfax, Wash., went forward on August 18th.

The Inter-Mountain Fair will be held at Salt Lake during the first week in October.

The new creamery recently started at Eagle, Idaho, is producing 400 pounds of butter daily.

Irrigation canals near Phoenix, Ariz., will be greatly damaged as a result of last week's storm.

The Society for the Promotion of Agricultural Science held its annual meeting in Portland, Ore., last week.

A colony of blastophaga has been imported to the Hawaiian Islands, and is reported as doing well on the Capri fig.

Farmers near Okanogan, Wash., expect a railway soon to be built, which will relieve the present inabilty to move crops.

A large irrigation project near North Yakima, Wash. has been held up by the rights of certain Indian owners of land.

Samples of rubber produced in the Hawaiian Islands have been forwarded to Germany and reported as of exceptional quality.

Arizona was visited by one of the most severe storms in its history last week, which did great damage in the vicinity of Yuma.

The first picking of hops in Oregon is expected to be August 26th. The wages will be one dollar per hundred. The crop promises well.

A farmer near Greeley, Colorado, asserts that he knows blackbirds have saved his beets from web worms which have become a great pest.

The Turkey Creek Reservoir and Irrigation Co. near Pueblo, Colo., is building an enormous dam which will give water for much additional land.

Farmers in Columbia county, Wash., are refusing to sell their wheat or barley at present prices, and are planning to store at least 2,700,000 bushels.

Owing to damage by spring floods, irrigation systems near Grand Junction, Colo., were put out of commission and great damage to crops resulted.

The meeting of farmers institute workers at Portland, Ore., was attended by representative men from all parts of the country, and helpful sessions were held.

At a recent meeting of farmers near Tucson, steps were taken to form a company to control the waters of the Rillito and use them to irrigate about 2000 acres of land.

Great excitement has been occasioned at Bellingham, Wash., by the raiding of fish traps by an armed body of men who stole between 40,000 and 50,000 fine salmon.

# For Eggs Next Fall Feed Now

# West Coast Egg Food

Don't make the common mistake of supposing that you can let the fowls get all run down before or during molting and then bring them up by heavy feeding later. You won't get eggs that way. They must be kept in good condition and fed feather producing and egg making food. We know how to make rightly balanced rations for such purposes. That is our business, and we have the best equipped mill for doing it, or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg Food, as good as anybody can make, by using

# EGG MORE

and you will get no unsound grain, no mill refuse and such stuffs, as are in many concoctions called Egg Food. Egg-More is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs if you feed it just a little each day. 25 lb. sack, $1.90; 50 lbs., $3.60; 100 lbs., $7.00. If not kept by your dealer we will prepay freight within 300 miles.

Eggs for hatching September 1st '09. Write for circular.

BOX 60, ROUTE NO. 1 SAN FERNANDO CAL

# Profit in the Poultry Yard

By Mrs. Frank Metcalf

**We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.**

## NOTES FROM AN AMATEUR

A FEW months ago I sent you an article on egg production, and requested that some of our poultry and egg producers give us facts and figures of their experience in the business. Mrs. Metcalf responded and I read her report with interest, as I do all of her writings.

My pen of Black Minorcas averaging seventeen hens since January 1st has done very well under very unfavorable conditions, for I have no green food and have to feed dry alfalfa hay, which I get in bales, chop up and feed mornings with bran mash. I received in the last seven months two thousand five hundred and eighty-seven eggs, being 152 eggs each, from my birds.

I received $64.60 cash for the eggs, as I supply a few private families with strictly fresh eggs at 30 cents per dozen the year around. Now, please do not lose sight of the fact that this is not a good average for my stock compared with what they produce when properly cared for. But I am convinced that a flock of such birds as I have is a paying proposition just for eggs.

Now, I want to say a word or two in regard to producing stock. First, one can afford to produce only the very best he can get, whether for eggs or for broilers. I have had twenty-five years of practical experience in producing poultry. I have raised chicks all over the United States and Western Canada and I believe this is the best place of all for the birds. I believe as a rule amateur bird raisers never count the cost of their good laying hens. Now, the birds of a good laying breed are light weight from 4 to5 pounds each, and some not over three to three and one-half so you hardly get pay for raising the cockerels up to broilers.

I would kill mine on sight if I could determine the sex, but I cannot, consequently I am blowing in high-priced feed on a lot of cockerels that will not pay out. So, you see, we have all this to charge up to the hen that we do raise and I found my early hatches produced over half males and the late hatches nearly all pullets. So, take it all around, you will find a pullet at six months old is cheap at $18 per dozen. That is, of good full blood laying stock either Leghorn or Minorca. I bank on these as leaders over all other birds for egg production.

I am not writing this article thinking it will interest the owner of large poultry plants. There is not a man on earth that has stayed with the chicks through thick and thin until he has one thousand or more but knows all about the business; but I like to hear from those with less experience and learn their results in the business.

I think it a great help to us in visiting other plants to see the way others handle birds. There are many little details that you learn; simple ones too that are of great benefit to any one in the poultry yard, and it is very interesting to see the many different ways poultrymen have in handling and feeding their birds. I have had the pleasure of spending one day with Mr. Hammond at Highlands. It was the most interesting chick talk I ever had in any one day. And that was not all. He had something to show me and that was one of the most beautiful, healthy and clean flock of White Rocks I ever saw. He is an up-to-date poultryman and a fine all around sociable fellow. Visit his plant and you will see what an educated poultryman can do on a large scale with money to do with.

Come to my yards and I will show you what a man can do without money to start with. Visit both sides and you can then draw a line that you can work up to without much risk of failure.

Now, I want to say a word about roup. I see so much about it and so many things advertised for curing it. Roup is a very serious affair for it not only hits a bird's head, but hits from its eyes clear to its lungs, and will kill a chick in short order.

I have had but very few cases of roup in my flock. It is simply from a cold and I find every case I have is from fault of my own. It is only when they are crowded and get so heated that they come out and get cold, which in most cases proves fatal. I cure them if I get them in its first stages. Keep only a few together and the roup will not hit them. That was always the case in my experience.

I never was a chicken doctor but when a two-pound chick gets to moping, and the egg for that bird cost me $1, it makes me sit up and take notice. Now, I would be pleased to hear through the Cultivator a report of egg production from any good flock of layers. I wish to learn what results people are getting here in California.—Daniel Webster, Rialto.

## DURING THE MOLT.

If ever a hen needed care and attention in her life, this is the accepted time. A whole lot of nonsense is always printed at this time of year about starving the hens a while to make the feathers drop out quickly, then stuffing them to make the new coat grow. Well, if you want to put your hens in a condition to catch any disease germs that may be floating around, and weaken their constitutions so they can't withstand sickness, just starve them as per direction and note results.

Rather than starve them at this critical time, increase the richness of their ration until they are in condition not only to produce the new coat of feathers, but a good percentage of eggs as well. More meat may be safely fed now than at any other time of year, if added gradually, a little more every day, and not all at once increased beyond the limit.

Green cut bone is excellent if perfectly fresh, but if doubtful, beef scraps and granulated bone would better be substituted.

Oyster shell, grit and charcoal are prime necessities, and plenty of fresh water at least twice a day.

During molting the skin seems especially irritable owing to the dropping out of old and growing in of new

feathers, and a fresh dust bath is greatly appreciated and most thoroughly enjoyed by our feathered friends, and if occasionally sprinkled with water and a handful of sulphur added, after it dries, it is still nicer for them.

**Feed.**

As to the grain ration, plenty of wheat and corn may be fed without danger at this time, as well as the mash in boppers, and green food, so that they may have the material to make themselves over and not feel the drain upon their vitality a starvation diet would result in.

The care of molting hens is not the delight it might be, and their appearance is not at all attractive just now, but remember if we would see them blossom out brightly in fresh new raiment, we must take especial care to furnish them the wherewithal of which that new raiment is to be made.

**Nits.**

And now is a right good time to go over the flock and look for those feathers at the base of the tail which are covered with nits, which are the eggs of body lice, and which may now be pulled out and burned without injury to the bird. If a bath is given each bird in either tobacco tea or some good safe lice killer, these feathers will be readily found and destroyed before the fertile eggs upon these feathers have a chance to batch, and what a lot of misery we can save those hens by this simple method!

The feathers from the molting hens sometimes contain lice and nits, and should be either swept up and burned, or sprinkled well with lice killer and not left to blow all over the place spreading lice and nits wherever they go. One can't just go around and pick them up one by one, of course, but those under the roosts may be destroyed or made harmless with a little attention, and every little helps.

**Spray.**

And if I had to choose a text for a sermon at this time of year on chicken raising, that text would be "Spray often and Thoroughly," for lice and mites grow like mushrooms this weather, and must be kept in check or the buildings will get in the condition a lady reported not long ago. When asked about how her hens did, she replied, "I don't even go out near the coops to look at them any more, for they are full of mites and the children get covered every time they hunt the eggs." Well, I should think it would be few eggs those poor hens could produce under such a state of affairs and I understand that these people declare that "chickens don't pay." Nothing in this world can be made to pay if neglected.

As well expect figs from thistles as to look for eggs from lousy hens, housed in a mite infested house. What a life of misery such neglect entails! It seems as if there should be an inspector of poultry quarters as well as an inspector of dairies, but, of course there is no danger of infection or disease from the eggs from such places for the simple reason that there "ain't any eggs," so that office will be a long time vacant.

And again I say. "Spray your coops, dip your fowls and feed your molting hens."

**Safe Dips for Poultry.**

Tobacco stems one pound (the refuse from cigar makers is just as good as anything.) Water one gallon. Put in an old kettle and bring to a boil. Have ready an old boiler or tub, the boiler being preferable on account of shape, and half fill with water, then add the tobacco tea as above, leaves and all, and dip the fowls thoroughly, wetting every feather to the skin. Hold by the feet and head, and draw the bird backwards through the liquid submerging it completely all but the head which may be quickly soused under at the last, squeeze out all the tea you can, and let the bird go into the sunshine, where it will quickly recover its equilibrium and choose a sunny spot to dry. Chicks half grown can be dipped in this with perfect safety, although it is best not to let them swallow any, if it can be helped.

Another safe dip is Creolium one part, water 50 parts, dip as above, but be careful to keep your hands in the shade while working with this, as it is apt to cause sunburn.—Mrs. Frank Metcalf.

Coulson's POULTRY FOODS

**Growing Chick ...Food...**

Can be fed damp as a mash or dry in hoppers. Feed it to your chicks up to 3 months old. Gives rapid growth and health.

It will save your grain bill, and you cannot afford to be without it.

Coulson's

**EGG FOOD**

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

For sale by dealers everywhere. Write for our free book "Poultry Feeding for Profit" with samples of our Poultry Food.

# Irrigation and Forestry

### DRY FARMING CONGRESS.

SECRETARY John T. Burns today issued the official call for the fourth annual session of the Dry Farming Congress, to be held at Billings, Montana, October 26-27-28, 1909.

The congress is called: "To discuss and compare methods by which the great area of arid land can be profitably utilized under thorough tilage by which the natural rainfall can be conserved.

"To encourage the use of methods by which, in districts where rainfall is slight, or irrigation water is limited, the actual productive acreage can be increased.

"To create closer co-operation between the government and state experts in charge of dry farming experimental work and the actual farmers of the arid districts.

"To enlarge the plans for carrying on a great educational propaganda by which, eventually, the arid districts of the entire world can be populated by prosperous and contented agriculturists.

"To encourage legislation looking to increased federal and state appropriations for the establishment of more experimental stations, the employment of more field experts and the actual co-operation of all these stations in fixing and maintaining a certain recognized standard of methods for obtaining results from the operation of farms in the arid districts.

"To study methods and results of dry farming operations in the various western states and in foreign countries which are represented in the Congress.

"To establish a better understanding of the value of agricultural education in the public schools of the west.

"To bring to the attention of active farmers the various theories and working plans whereby each farmer may assist in the general commercial, social and political uplift of the western states."

### TIMBER BURNED UP PAYS NO WAGES.

DO your best to prevent forest fires.

Would you set fire to any man's house?

If you saw his house burning would you pass by without doing anything?

Do you realize that timber is quite as avaluable to the owner, and much more so to the community and to you? He can build a new house but not a new forest. As for your own interest, think over the following facts.

California has one hundred and sixty billion feet of standing timber, even now worth $400,000,000 as a resource.

If manufactured and sold, even at present lumber prices, it would bring $2,500,000,000 into the State for labor and supplies.

California sells over $20,000,000 worth of lumber a year. Of this $14,000,000 is received by employees who put it into local circulation. You share it.

About a billion feet is destroyed by fire in California every year. If manufactured it would bring in $15,000,000.

On every thousand feet burned the stumpage owner loses at least $3, but the community loses $8 in wages.

Timber means pay checks to support all industries, but burned timber pays no wages.

Timber pays taxes in your county; if it burns up another kind of property has to pay the difference.

Help prevent forest fires and you'll make more money. So will your children.

Care with small fires is the best way to prevent big ones.

Therefore, you are urged to observe the following simple rules:

Don't toss away burning matches or tobacco!

Don't make a camp fire in leaves, rotten wood, or against logs, where it may spread or you can't be sure it is out!

Always clear away all inflammable material before building your camp fire!

Never leave a fire until it is out!

Don't burn brush, grass or slashings without a permit from a Fire-Warden.

Don't operate an engine using fuel other than oil without having it equipped with a spark arrester.

Put out any fire you find if you can. If you can't, notify a Firewarden or other public officer, or the landowner. Remember that any little fire may become a big one if left alone.

All these rules but the first and last are Law, and violation of them is punishable.

Next to water, earth is the best thing to put out fire with. The best tools for fighting fire are the shovel, ax, mattock and wet sacks.—From circular issued by California State Board Forestry.

### LIGNUM-VITAE.

In view of the rapidly decreasing supply of lignum-vitae (Guajacum officinate) of the West Indies, the Philippine Bureau of Forestry conducted an investigation for the purpose of finding a wood capable of replacing it. As a result of this work, mancono (Xanthostemon verdugonianus), the hardest and heaviest of Philippine woods, is recommended as having enough good qualities to serve as a substitute for lignum-vitae. It is urged that the wood be tried by all hardwood manufacturers, since the species is found in merchantable sizes and quantity and can be cheaply exploited.

One official test of this wood was made by the U. S. Naval Station at Cavite, in which it was installed in a launch as a bearing for journals rotating in salt water, and was found to be but little worn at the end of seven months. It is considered to be the equal of lignum-vitae when both woods are used for bearings on side grain.

An alfalfa mill recently destroyed by fire near Tehama is to be rebuilt.

# The Ames Continuous Flow Deep Well Pumps

# Bees and Their Care

By Henry E. Horn, Riverside

### PRACTICAL INSTRUCTIONS FOR BEGINNERS.

ONE day in June, 1876, my younger brother and sister coming from school saw a swarm of bees fly overhead. I can remember it as well as though it were yesterday, how I found fault with them for not telling me until after the swarm was out of sight. Probably fifteen or twenty minutes had elapsed after the bees had passed over the road; and since colonies in movable-frame hives were worth $10.00 in those days, and since I had had the bee fever for some two years, I made up my mind to locate that swarm. I was shown where it crossed the road and the direction it took. Before I had gone into the woods ten rods I heard the bees entering a tree, and I soon saw them, for many were still on the outside, while others were circling around making a great noise. They entered a limb well up toward the top of a large elm.

That night I asked a bee-keeper when it would be best to transfer the bees from the tree to a frame hive, and he told me that I could do no better than to do it immediately, for the reason that, if the tree were felled before the bees had time to build any comb they could be hived like a natural swarm, without the inconvenience of transferring sticky combs, etc. A third of a century has elapsed since this took place; and if I were asked today how to manage in such a case I would give the same answer that this bee-keeper gave me. Well, the tree was cut while the bees were flying during the next day; and although their entrance had been 60 feet from the ground not a bee was lost; for as soon as those in the tree started into the new hive, all of the bees heard the "homing hum" and entered the new hive with the rest.

As soon as the tree was down, and before the bees got over being demoralized, the bee-keeper who was helping me ran toward the top of the tree; and as soon as he could locate the entrance he smoked the bees so that they could be handled without fear of stings. By sawing in on each side of the entrance, and splitting off a portion of the limb, we opened the cavity where the bees were. The hive was then placed with the entrance as near as possible to the part where most of the bees were, and with a tin dipper the greater part of them were dipped up and emptied at the hive entrance. By the time we had most of the bees dipped out of the tree in front of the new hive there was this loud "homing" call as the bees commenced running in. At this point of the procedure the few bees that were left in the tree were smoked until they took wing, and then we stepped back so as to be out of the way. All of the flying bees, attracted by the loud hum, soon entered the new hive, which was moved home that night when all flying was over for the day.

It occurs to me to mention here the fact that any beginner noticing a swarm issuing should not rush off to a neighbor for a hive, leaving the swarm clustered, for, as likely as not, the bees will be gone on his return. The better way is to hive them in a soap-box or anything else, for that matter, that can be used temporarily, and, when hived, the box should be set on the stand where it is to remain until the new hive can be brought. Then, as soon as the new hive is obtained, he should go to the swarm in the box and blow some smoke in at the entrance in order to avoid stings. (A beginner should wear a veil until he is thoroughly acquainted with the bees, simply so that he will not be nervous.)

As soon as the new hive is ready the box should be removed from the stand and the empty hive set in its place, with a board slanting up from the ground to the entrance. Now the swarm may be hived just as though it still hung on the tree or limb where it clustered at first. By carefully lifting the box off the bottom-board, and carrying it to the new hive, most of the bees can be shaken out on to the alighting-board with a quick jerk, and they will run in just as though they had been shaken from a limb.

To return to my swarm taken out of the tree, I will simply say that it was divided that season, both colonies gathering sufficient honey to winter well.

#### Tools For Bee-Keepers.

An indispensable tool in the apiary is a good smoker. After using all of the different sizes of smokers made I recommend the larger sizes as being far superior to the smaller ones. A smoker of the 3½ or 4-inch size is the proper one to buy. They cost a trifle more than the smaller ones, but this extra cost is offset many times, for they burn longer and give off a more dense smoke; in fact, there is no argument that can be advanced in favor of the small smoker. A common mistake that most beginners make is to buy small or cheap tools and hives. I believe that the main reason why the eight-frame hive is more universally used than the ten-frame is because the first cost is less, and those who start with the eight-frame hesitate to make the change.

#### How Many Colonies To Start With.

The first things to decide upon are the number of colonies to buy, the size of hives, and the season of the year when the start should be made. When I began bee-keeping, many of the colonies around me were in hives of a size and style not to my liking; in fact, there was no standard frame in use then as there is now, and the beginner simply followed some one of the leading honey-producers, adopting his hive and frame. All these things are now changed, and the beginner will have no trouble in finding bees in hives containing regular Langstroth frames. This frame has more points in its favor than any other at the present time, and I would advise the beginner to adopt it.

There is a great diversity of opinion as to the proper number of frames to use in a hive. The majority use eight frames; but quite a number use ten frames to the hive, and a few think that twelve frames are none too many for the best results. It is not the intention of this article to go into the discussion of the hive question; but if the beginner will take my advice he will adopt the ten frame hive for the production of comb honey, but especially for extracted honey.

After deciding on the size of hive it is important to get the right number of colonies to start with. Beginners should understand from the first that there is much to learn, and that the first few years will be largely experimental, so that not much money will be made at first. The experience can be acquired about as well with a few colonies as with a large number, and the expense is much less. When starting on a small scale, the increase of bees and experience go together.

It is noticeable that those who have gone into the bee business on a large scale from the very first, without making an effort to get the necessary experience, have usually turned their attention to something else in a few years, usually going back to what they did before. This is the natural thing; for since they knew nothing about the producing of a paying crop of honey the venture proves a failure.

I would recommend at the start from two to four colonies, whether the beginner has much capital or not. I do not think that one without experience can go into this business and depend upon hired experienced help to do the work, for he must know the details himself before he can manage others in such a way as to make a financial success of his plans.—Gleanings.

SECURITY SAVINGS BANK

Security Building, Fifth and Spring Streets

Established 1889
Oldest and Largest in Los Angeles

### Pasteurized Cream.

What is Pasteurized cream? How is it effected?—G., San Diego.

There are several small pasteurizing outfits on the market that are used for milk intended for the baby. Then there are large steam outfits used in the creameries. One can readily be improvised in any kitchen. Secure several glass jars and after scalding them well, bake them dry in the oven. Put in the cream and tie a piece of absorbent cotton over the top to act as a filter for the air. The jars are then stood in a deep vessel on wooden slats, to prevent them coming in direct contact with the heat. Pour in cold water around them, set the vessel on the stove, bring the water up to the temperature of 150 degrees. Set the vessel off the stove and cover it closely for an hour. Then add cold water to the hot until the jars are cool enough to handle. Lift them out and chill as quickly as possible down to 50 degrees and hold the temperature there. Each day's cream is pasteurized at once and left in the jar with the cotton tied over top, until twenty-four or less hours before churning time. Then the cream is stirred into a can and well mixed, the starter added to it and the temperature raised to eighty degrees and held there until the cream has developed a sprightly acid taste, when it is cooled down at once to churning temperature and made into butter. The simplest starter is made by taking fresh milk, sweet skimmed will do if the cream has been run through a separator. Place it where it is held at eighty degrees until clabbered and use a starter at once. A starter of buttermilk is some times used but it must be kept very cold in order not to be over ripe when introduced into the pasteurized cream. A starter must be used if the butter is to be made from ripened cream, as the lactic acid bacteria have been destroyed in the cream and it will simply not sour, but turn bitter and rancid.—M. E. S.

Bailey's Cyclopedia Says:

Pasteurization is the destruction by heat of a large proportion of the micro-organisms in milk. The principal advantage of this treatment, from the commercial standpoint, is the improvement resulting in the keeping quality of the milk. From the standpoint of the hygienist, the advantage of pasteurization is chiefly in the fact that this treatment can be depended upon to destroy pathogenic organisms.

The chief value of pasteurization is at times when there is a general outbreak of a contagious disease, when it is not known but that persons handling the milk are affected with the disease. In all such cases the milk should be pasteurized, and after treatment, protected with the utmost care to assure no further infection.

Probably the most resistant of organisms that are likely to be in milk is the bacillus of tuberculosis. To kill these germs, milk must be heated to 150 degrees for thirty minutes, or 157 degrees for fifteen minutes, or 167 degrees for ten minutes, or to 180 degrees momentarily. It has lately been shown, however, by Smith and Russell, that it is sufficient to heat the milk only to 140 degrees for twenty minutes, provided it is heated in closed receptacles. For market-milk purposes, this lower temperature is preferred because it is not accompanied by the cooked flavor, which is objectionable to many persons.

An essential part of the work of pasteurization consists in cooling the milk. The operation really is not completed until the milk has been cooled to a point below 50 degrees, at which bacteria grow but slowly.

### Erinose.

Please let me know through the Cultivator what is the trouble with the enclosed grape vine leaf showing brown appearance on the under side. This shows on only one vine. I wish to know if it is a serious matter and how to control it.—62, Orangevale.

This was referred to Prof. R. E. Smith of the Southern California Pathological Laboratory. He writes: "I would say that the vine leaf is affected with the trouble called "Erinose." This is caused by a very minute insect which infests the under side of the leaf and causes the characteristic effect. This is not usually a very serious matter, but may be treated with dry sulphur similarly as in the case of mildew, if it seems to be getting too abundant."

### Sunburn.

I send bunch of grapes dead and decaying on the upper side. They are somewhat worse on the top of the vine, but also show the same trouble underneath. What is the cause and remedy?—C. W. A., Los Angeles.

This bunch of grapes was sent to Prof. Smith at the Pathological Laboratory, but being away, the query was answered by Mr. C. O. Smith, assistant plant pathologist, as follows:

The parcel containing the diseased grapes was received as well as the letter to Professor Smith concerning them. Prof. Smith is at present in the northern part of the state, but will return in a few days. The trouble is without doubt what is known as sunburn. I find no fungus or anything of a parasitic nature.

### Ants on Plants.

What can I do to get rid of ants on cosmos plants? They have eaten nearly all my plants. I have used an ant poison, but it killed the cosmos. The ants eat the new shoots near the tops, not at the roots.—E. G. S., Los Angeles.

We believe this is caused by the aphis taking the vitality of the plants at the tops. The ants are attracted to the plants by the aphis. At least, we have never known of ants eating the tops of plants to any serious extent. If a kerosene emulsion or tobacco spray of some kind is applied to the aphis which are working at the tips of the shoots, we believe the trouble will disappear. If you wish to destroy the ants and they can be traced back to their holes, a little carbon bisulphide poured down each hole, the hole then being covered with a wet sack, will probably finish them.

### THE AUSTRALIAN SALT BUSH.

The Australian Salt Bush has been strongly recommended for sections having very little rainfall and for alkali land. Dr. Wm. P. Headden, of the Colorado Experiment Station, has grown it at Fort Collins for eight years without irrigation. In one year, he found that a good yield was secured from a planting made late in June. Doctor Headden has fed the Salt Bush to sheep and horses. His conclusions are as follows:

First, when once established, it will endure drought and even make a good crop, with less than five inches of rainfall. Second, that stock will eat it or readily learn to eat it either green or as hay. Third, that it will produce very heavily under favorable conditions. Fourth, that it will, when fed alone, maintain the animals, and even better results are claimed for it. Fifth, that the hay is rich in protein, as rich or even richer than alfalfa. Sixth, that its co-efficients of digestion are excellent, except for the fat or ether extract and crude fiber. Seventh, that it has no injurious effects on the animals, even when they have no other fodder with it.

The following facts, however, remain; that it has not become popular, and that when fed alone it does not produce the results that its composition and co-efficients of digestion would seem to warrant us in expecting. There is no reason for questioning the advisability of feeding something relatively richer in carbon. It is a fact that stock will live on this fodder alone.

The horticultural commissioners of Kings County report a plentiful supply of vine hoppers that are doing some damage to the vineyards.

Kern county will produce hay and grain this year to the value of over a million and a quarter.

**SAN FRANCISCO BUSINESS COLLEGE**

ALBERT S. WEAVER
PRESIDENT

Cor. Market, Eddy, and Powell Streets, San Francisco

New building, new equipment; located in the best business district. One of the lightest, most convenient and best-equipped business colleges in America. Write for information about the great opportunities offered to trained office workers in the new San Francisco.

**WHO WANTS A BABY?**

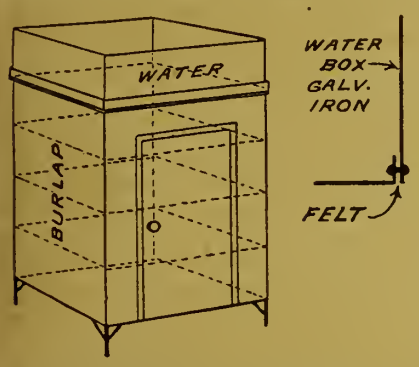
Chick, prices right now, 10c and up. After September, they will be more. Our NEXT BIG HATCH will be due September 6th, at which time we will offer for sale most all kinds of chicks, at our old prices. Order now and make a small deposit and contract for chicks at the low prices. Later the same chicks will cost you more. When the eggs get high we will positively have to raise the prices of the chicks. People that buy now get the benefit of the old price and can get the chicks when they wish. Better investigate today. Free chicks book tells all about it.

**Pioneer Hatchery Company**
*112 East Eighth Street, Los Angeles, California*

### BURLAP COOLER.

Cultivator representatives have noticed in various parts of the state the popularity of burlap cabinets used in place of refrigerators. It has also been noticed that while these useful affairs are very common in some sections of the state, they are practically unknown in others On account of this, The Cultivator will endeavor to suggest it to those unable to get ice and who appreciate the handy cool cabinet convenient to the kitchen. In some places these coolers are regularly manufactured, but in most cases it has been noted that they are the home made affairs, such as any handy man can make.

They may be of any size, but a good ordinary dimension would be 18 x 36 x 48 inches with the water box in addition on top. The frame could be made of 1 x 3 strips covered with burlap and fitted inside with three or more shelves, these shelves serving to stiffen the frame, assisting the top and bottom which should also be of inch stuff. The next thing



is the water box, the idea being to arrange some plan by which water can be kept continually running down the sides of the cooler, keeping the burlap wet. The cooler is usually placed on an airy back porch or under a tree where a breeze will cause rapid evaporation and necessarily lower temperature inside. This box may be galvanized, the bottom and sides in two parts and jointed as in the accompanying cut or it may be wooden with partially plugged holes, sufficiently close together to answer the purpose.

The whole should be raised from the ground by legs formed by the extension down of the corner posts of the frame.

A better idea of the construction is had from the small engraving given above.

### NECESSITY FOR LIME.

"Lime is one of the things most lacking in American farming land today." "You can hardly detect a trace of lime in some of our soils, and yet that the soil be properly fertile to produce the proper results, it should always have an excess of lime in it, not because lime is such an essential constituent of the plant, but because of its effect upon other constituents of the soil, and upon the nature of the soil itself. I have just told you that organic nitrogen, like dried blood, tankage and cottonseed meal, is a splendid nitrogenous fertilizer, but it must first be converted into nitric acid. Then the acid formed retards the development and the growth of bacteria. The moment these organisms begin to convert cottonseed meal into nitric acid they begin to make the soil acid, and tend to hinder their own works, and will stop it altogether in a short time, unless there is something to take charge of that acid. There is nothing so good for that as lime. Wherever there is plenty of lime to combine with this nitric acid and form nitrate of lime, nitrification will go on with the greatest vigor and the plants will have an abundant supply of nitrogen in their foods, but the very moment that lime is deficient then nitrification goes on with diminished speed and finally stops altogether. That is one of the essential reasons for the usefulness of lime.

"You may wonder why the lands in England that have been under cultivation for so many hundreds of years are still so fertile, and you wonder why they do not grow acid, and why the bacterial organisms do not cease to work. The reason is that the great part of England is chalk. At the grounds of the great agricultural station in England you can pick up lumps of chalk all through the soil, and if you pour a little acid on that soil it effervesces like water from a soda fountain. Now there is a soil which you can manure with barnyard manure for an indefinite time and still you will never make it acid, and still you will have nitrification going on with vigor.

"I say that our farmers must learn to use lime. The beet farmers have an excess of lime in the refuse of their factories. Thousands of tons of lime cake are thrown out every year, every pound of which is specially valuable and should be carefully preserved and placed back on the fields; and if that is not enough, they should buy lime if necessary, if they have not got limestone on their own land. It is not necessary for it to be burned, except that it is the most convenient way of reducing it to a powder; but ground limestone or ground chalk is just as efficacious. Our people are only awakening to the fact that they must have lime, and have it in abundance.—H. W. Wiley in address before Beet Sugar Association.

## Veterinary

**Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.**

**Cocked Ankle.**

Is there any cure for what is known as "cockled ankle" or "cocked ankle?" The horse is young and in fine condition. Another horse has swollen legs, due partly to standing in the barn, but I think his circulation is poor or sluggish. What would you suggest as a remedy?—H. F. C.

This arises from a weakness of the parts, often from being worked too young. Would suggest shoeing with calks on heels and none on toes of shoes. The idea of this is to rest the tendons and ligaments in the back of the ankle. Then blister the ankle with Gombaults Caustic Balsam.—R. T. W.

**Side Bones.**

I have a horse 11 years old that has been lame in nigh, forward foot for the past week. Only trouble I can find is a hard slight swelling at crown of foot on outside. Can this be ringbone forming, if so what treatment can I use. Is there any medicine or liniment that will disolve this if taken now?—C. E. Crows Landing.

It may be a ringbone but is more likely a side-bone, which is an ossification of the lateral cartilages.

Firing with pointed firing irons is good treatment in either case.

If it is side-bone the thinning of the wall under this swelling from top of hoof to near the bottom will be advantageous. File until it will dent easily under pressure of the thumb, then poultice.—R. T. W.

**DR. WHITTLESEY'S VETERINARY REMEDIES.**

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quittors," "Thrush," "Scratches," "Warts," "Cellar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

## Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

**MISCELLANEOUS.**

HOME CANNING OUTFIT JUST LIKE factory canneries. As simple to operate as the open dishpan. When prices are low and fruit and vegetables are going to waste, save it all by canning and then you can hold for better prices. A book of instructions of how to can corn, peas, beans, etc., how to make and can all kinds fruits and jams, etc., goes with each outfit. Send your name so I can tell you all about it. M. HILTON SMITH, Alice, Texas.

FORTUNES IN SUGAR—STOCK FOR sale in a new sugar cane plantation. Small monthly payments will secure for you an interst in this great enterprise, that will pay you an annual income for life. Write for booklet, LOS HORCONES PLANTATION CO., 724 Grosse Building, Los Angeles, Cal.

THE PEERLESS HONE MAKES ANY old razor shave like a new one. Anybody can use it; everybody will use it. No strap necessary. $1.00 postpaid. Agents wanted. PEERLESS HONE CO., 397 Whitney Ave., Los Angeles, Cal.

EDISON PHONOGRAPHS. THE NEW kind, the best entertainers on earth. We deliver free. Ask for catalog, full line of records. COLUMBIA COMMERCIAL CO., 204 East 9th St., Los Angeles, Cal.

FOR SALE—SMALL DRYING PLANT, trays, cars, wheels, picking boxes. L. N. or KEITH SUYDAM, Glendora, Cal.

**RUBBER STAMPS.**

SEND IN YOUR ORDERS FOR RUBber stamps, dies, stencils, etc. Catalogue on request. F. W. HOPKINS PTG. CO., 641 S. Main St., Los Angeles, Cal.

**SITUATIONS WANTED.**

A FARMER, UP-TO-DATE AND A hustler, wants place as foreman or superintendent. Is thorough in general farming, irrigation, vine and deciduous fruit growing. Experienced in working all kinds of labor, both tenant and wage systems. Address Box H, California Cultivator.

## KEEP YOUR GRIT.

Hang on! Cling on! No matter what they say:
Push on! Sing on! Things will come your way.
Sitting down and whining never helps a bit;
Best way to get there is by keeping up your grit.
Don't give up hoping when the ship goes down
Grab a spar or something—just refuse to drown.
Don't think you're dying just because you're hit;
Smile in face of danger and hang to your grit.
Folks die too easy—they sort of fade away;
Make a little error, and give up in dismay.
Kind of man that's needed is the man with ready wit.
To laugh at pain and trouble and keep his grit.—Ex.

## STANDING GUARD

(Scene, the sunny veranda of a golf club on one of the rare warm spring days. On the top step sits a pretty girl and on her outspread skirt placidly sits a bulldog. He is an extremely ugly, strong-jawed, healthy looking specimen of his kind, and he stares out over the rolling links in superb indifference. The girl suddenly looks at him with a little frown.)

She—"I wish Ted had remembered to take this creature with him when he was called to the telephone! I'm not exactly afraid of him, but—he makes me nervous! I can't get away and there comes Sam Ponsonby!"

Ponsonby (who approaches with an air of triumph)—"Oh, there you are! I've been looking everywhere—thought I saw you drive in. Won't you go around with me?"

She (reluctantly)—"Why—er—that is—thank you!" (Aside.) "Ted didn't really ask me to play and maybe he isn't coming back, and I can sit here all day!" (She attempts to rise, but the bulldog remains a dead weight on her skirt.)

Ponsonby (snapping his fingers at the dog)—"Here, now! Clear off!" (The bulldog does not even look at him.)

Ponsonby (with an ingratiating whistle)—"Good doggie! Good doggie! Come on, Sport!

She (helplessly)—"His name is Nebuchadnezzar, and he doesn't answer to anything shorter. Won't you please move Nebuchadnezzar?"

(The dog gives her a swift, friendly glance and resumes his meditations.)

Ponsonby (nervously)—"This is absurd! Whose beast is it? I might have known that no one but Ted Bradford would be so inconsiderate of a lady's feelings and—and possible inclination! Get out of here, Nebuchadnezzar!"

Bulldog (sotto voice)—"Gr-r-r-r-r!"

She—"Look out! He's dangerous!"

Ponsonby (walking around the dog and the girl)—"They shouldn't let Bradford bring a bad-tempered brute here! It's against the rules, I'm sure. It ought to be reported! Here we're losing good time and—and everything! Can't you do something? He seems to know you!"

She (with innocently wide eyes—"Why, you're not afraid of him, are you, Mr. Ponsonby? I didn't think—"

Ponsonby (goaded to daring, flicks at the dog with his driver)—"Afraid! I! I merely hesieated to arouse his evil temper when he is so near you. He might bite!"

Bulldog (turning on Ponsonby and showing a row of long white teeth)—"G-r-r-r-r! Wooft.

She, shrinking)—", don't. You see? Nebuchadnezzar, listen! I love you, but please run away!"

Ponsonby—"Nice boy! Come, get a bone! You try to pull away from him while I distract him! Nice boy! Nice bone! Nice—

Bulldog (moving heavily over so that he leans against the girl and regarding Ponsonby with extreme disgust)—"Woof-woof. Gr-r-ack!"

Ponsonby (very red in the face)—"I don't know what you think about it, but my opinion is that Bradford ought to be brought up before the committee for this! Why, you might be eaten alive, or—"

She—"No. Nebuchadnezzar seems friendly enough to me! Bou you're losing your game! Do go on—and find some one else to play with you!"

Ponsonby (heroically)—"And desert you with this—this monster keeping you a prisoner? You might have to sit here forever! Where is Bradford, anyhow?"

She (forlornly)—"He was called to the telephone. Business, you know!"

Ponsonby—"He's probably forgotten all about you and gone into the city or something! He has no manners! What any one can see in—here, Nebuchad—"

Bulldog smiling)—"Yp! Yp! Gr-r-r! Woof!"

Ponsonby (leaning against a post)—"Well, what on earth are you going to do?"

She—"What on earth can I do? Do it yourself! If you really wanted me to go around with you you'd do something. Why, you're ten times as big as Nebuchadnezzar!"

Ponsonby (aghast at her cruelty)—"But—but—look at his teeth! I haven't teeth like that! And you know I want you to go around with me! I always want you to go around with me! I always want you, but you're always busy with some one else or —"

(A tall, good-looking young man strolls out of the door at this juncture. He is smiling as one whose forethought has worked out a situation in the way he had hoped. At his whistle the bulldog springs up and rushes to him."

Bradford—"Ulio, Ponsonby! I'm sorry I was so long, Sue. Come on, now for our round!"

Ponsonby (hands in his pocket, feet outspread on top step, watching the pretty girl and his rival walking away, the bulldog trotting behind)—"If I thought Bradford did that on purpose I—I'd—heavens! I wish I had Nebuchadnezzar's teeth!"—Universal Magazine.

## REMEMBER THE BIRTHDAYS.

One of the saddest things in life is to look back on a childhood devoid of all the little attentions every child should have. One of the best and happiest experiences to an adult is to cali up the memories of by-gone holidays, made bright by a mother's care and forethought. Since it takes so little to make children happy a long, long time, it is too bad that ever a little boy or girl goes without good times and gifts on Christmas and birthdays and Easter. Especially on the farm, where a birthday treat is only a matter of a little extra work, does it seem unpardonable that the

natal day should be just like a common, ordinary day.

A very busy mother who, in addition to her own cares, had special duties to perform for two aged people in the family, always made it a point to have a cake for each member of the family on the birthdays. For the baby, it was a pretty little one covered with white icing and decorated with as many fat chocolates as years, no candles were used in the family for fear of accidents, and for each member, some distinctive touch. One of the boys liked an elaborate design in red peppermints and somebody else demanded pink frosting, but each and every one had a birthday cake if nothing else. Often there were little homemade or purchased gifts, though money was not plentiful in that home but if there were none the cake still reminded the favored one that mother delighted to remember his advent into the world.

In another home where nearly all the birthdays come in pleasant weather there are picnics, fishing, frolics and nutting parties to celebrate the great events. The whole family unite in a good time with a delicious dinner, so that whether there are presents or not, every birthday is looked forward to with keen anticipation, and remembered long afterward with pleasure Of course, if all the birthdays came in winter this would be out of the question, but other delights could be planed. No matter how much work is to be done on the farm, there should be some holidays for every one in the family, and birthdays furnish these convenient occasions.

Still another mother allows the children to choose their birthday joys. To be sure they must stay within reason, but children seldom want unreasonable things, unless they are badly spoiled Once it was a taffy-pulling, once a picnic, once a family dinner, once a little excursion to a nearby city, and so on through the list, all simple pleasures, and all within the reach of the parents who were not rich by any means. Once the whole family combined on the mother's birthday and chose some good books and magazines they could all enjoy, and sometimes just a family feast celebrates the great day, but always there are celebrations of some sort.

In inexpensive gifts the list is almost endless. The great advantage of giving to unspoiled children is that they never count up the cost of the article, but thankfully recieve it, and treasure it long after the giver has forgotten all about it. Hair ribbons, handkerchiefs, pencils, little bottles of perfume, books, thimbles, games, pin cushions, needle books and various other trifles for the girls, and marbles, knives, balls, fishing lines, skates, cards and countless other little things appeal to the lads of the family. A little girl cherished for years a tiny bag made of a discarded silk necktie which held a thimble, thread and various other sewing materials. It drew shut with a fascinating pink ribbon and long after the silk and ribbon had faded a dull gray it still held her treasures. A little cup, a plate and tiny bowl or some such thing is hoarded for years, and occupies a large place in the child's affection, just because it was received on a birthday or Christmas.

If you can only spend five cents and bake a cake for each child, by all means do so, for the birthdays while they will be children will be very few indeed. Even a needed new dress or an apron made a little more elaborate than for other occassions will answer for a gift, and make the day a happy one. There are few farms where a chicken dinner with cake and ice cream for dessert are not possible on each birthday, and there are few fathers and mothers so poverty stricken as to be without a little money for a gift. If the birthdays are neglected it is simply neglect, not want of time and money that is responsible. Try to put yourself in the place of the child and see how it would hurt you to go to school and hear other children talking of their good times, and have to confess with shame and bitterness of heart that your own birthday passed unnoticed. Once you enter into the child's side of such questions you will have time to remember every birthday and holiday. —Farmers Tribune.

### WHAT CHARLIE HAD.

Several of the scholars had returned to Sunday school after being absent some weeks on account of illness, says the Delineator. "I had the measles," said one litle girl. "I had the mumps," said another. "So did I," said a third. The superintendent heard them and, addressing a curly-headed boy said: "Well, Charlie, you were absent, too. What did you have?"

Charlie's face blushed. He thought a moment and then sang out in high treble, "I had a little brudder!"

---

"How do you tell bad eggs?" queried the young housewife." "I never told any," replied the fresh grocery clerk, "but if I had anything to tell a bad egg I'd break it gently."—"Christian Guardian."

---

A plain drunk fell into a bath tub at the Pueblo jail and thinking he was on a sinking ship told the attendant to never mind him but save the women and children.

COOL WATER IN THE HOT SUN
"No, Mr. Sun, you can't warm the water in the Appell Water Bag."
SOUTH AFRICAN WATER BAG
THE ADAM APPELL CO.

Angle Lamp
The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 1 quarts of oil.

### Honey.

White comb .....14@15
Light Amber .....10@12
Extracted W W .....7½
Extracted light amber .....6½@7
Beeswax per lb .....25@29

### Hay.

Scott, Magner & Miler say: Receipts of hay for the week just ended have been 5250 tons.

Many farmers, who apparently believe that the present market is not as good as the future may develop, have put their hay in the interior warehouses on storage. These warehouses, both public and private, in all sections are being filled rapidly, and in fact many new barns have been planned and built to receive much of this hay.

What the future may develop must depend very largely upon the kind of a season that we may have.

There has been very little hay change hands in the country during the last two weeks, for the reason that there is a marked difference of opinion between the ideas of the farmers hoiding hay and of the buyers who are in the market.

This week's quotations are:

Choice wheat hay .....17.50@18.50
No 1 wheat or wheat & oat 16.00@17.00
No 2 wheat or wheat & oat 13.50@15.00
Choice tame oat .....16.00@17.00
Other tame oat .....12.00@14.00
New crop wild .....11.00@14.00
Stock hay .....8.50@9.00
Alfalfa .....10.00@14.00
Straw .....60@75

### Grains.

Wheat No. 1 .....1.70@1.75
Barley .....1.35@1.41¼
Oats white .....1.60@1.62½
Oats gray .....2.00@2.10
Rye new crop .....1.70@1.75
Corn Egyptain .....1.60@1.65
Corn Cal sm round .....1.80@1.82½
Alfalfa seed, Cal .....16@18
Mustard brown .....3¾@4½
